## Backup Alarms

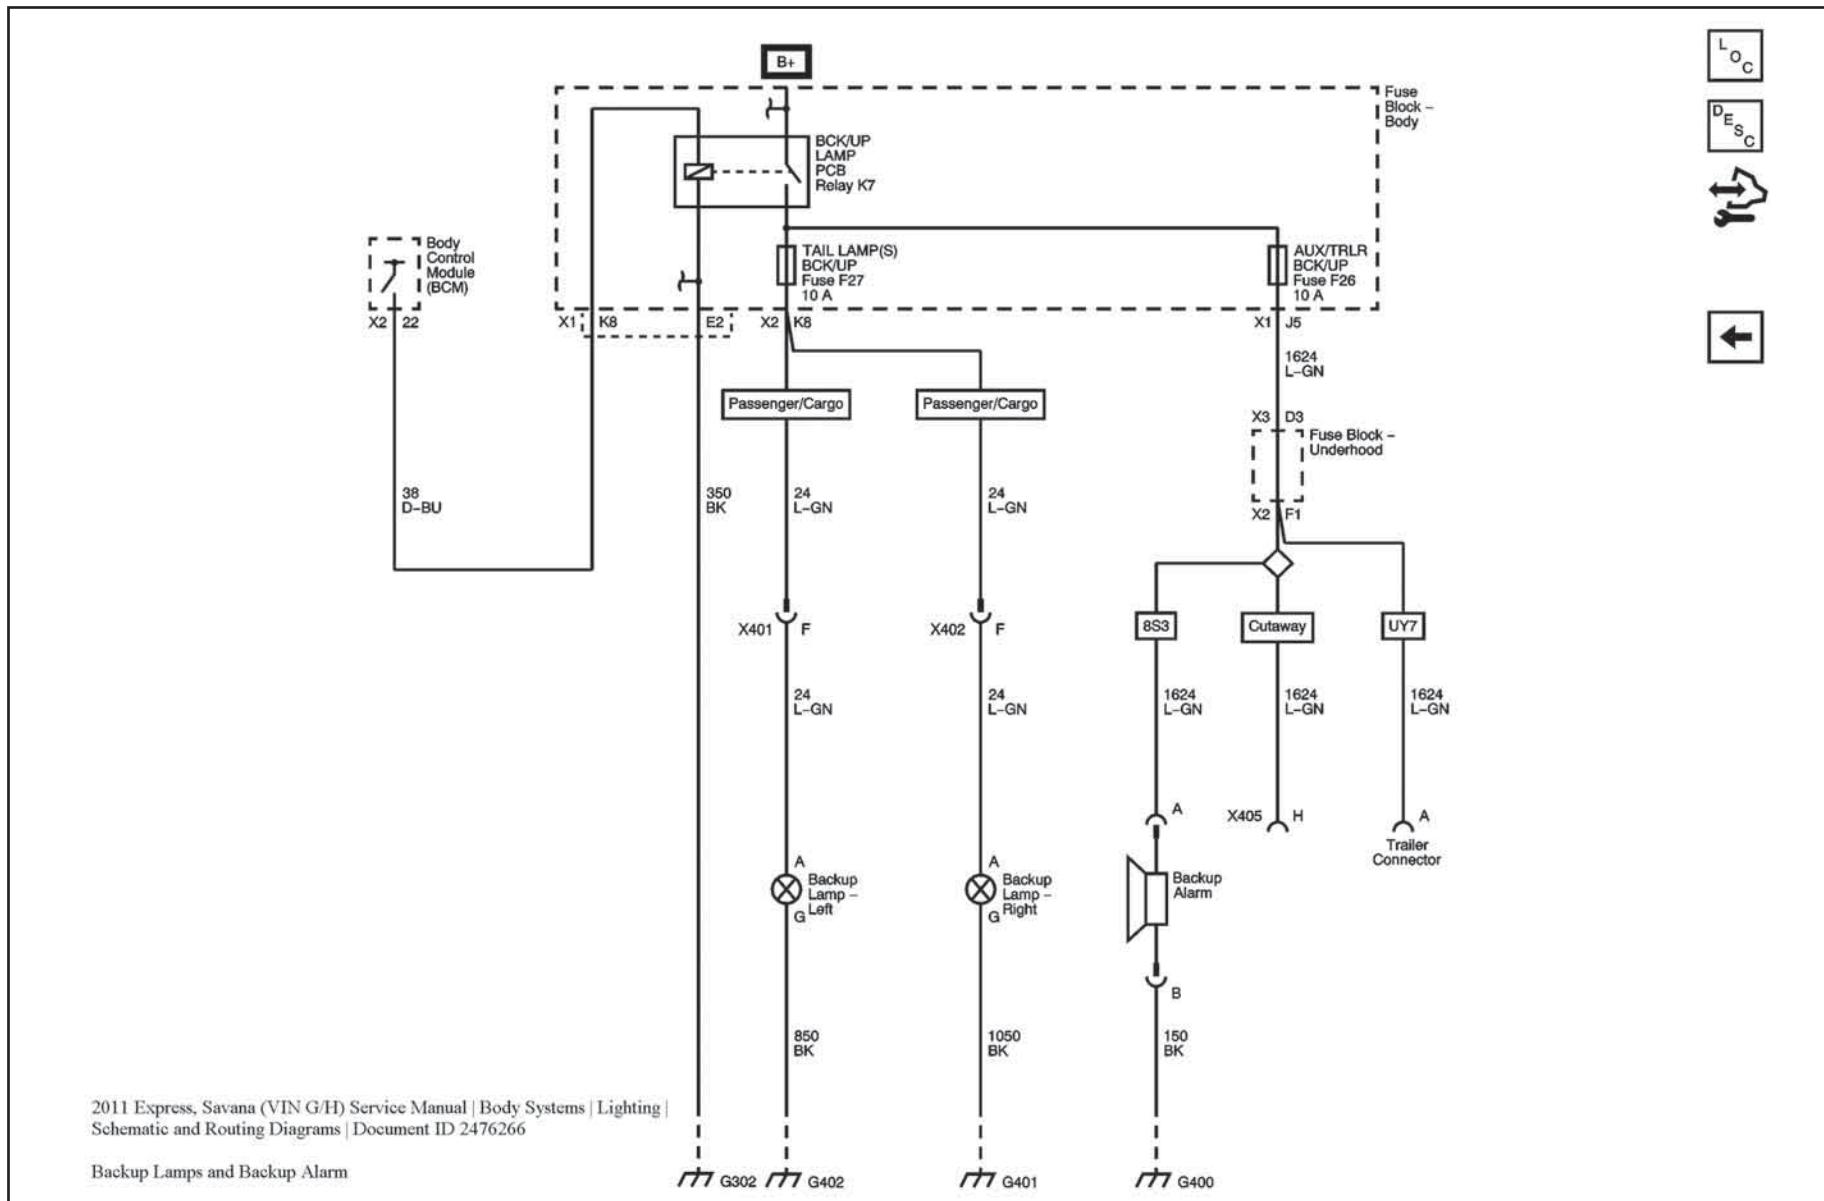

### **Backup Alarms**

For installation of backup alarms on units with out option code 8S3 [factory backup alarm - loose shipped] connection can be made at the rear lighting connector X-405-H Light Green 1624 wire. [For 8S3 see schematic on page A-42.]

If the backup lamps illuminate in peremeter lighting and key fob acknowledgement modes there are two solutions for correct operation of the backup alarm:

1. Return the unit to a GM dealer to have the BCM software for option 8S3 loaded. This is a fee for service activity.
2. Install an ignition controlled relay to connect the alarm to the 1624 wire such that the relay is closed [alarm connected] with key on. See simplified schematic.

## In Cab Ignition Control Signal

A switched ignition control signal can be found on the stop lamp [brake] switch cavity B [pink 239 wire] and also at connector X221 cavity B. This signal can be used to close a control relay to power your application with a fused power feed to battery +.

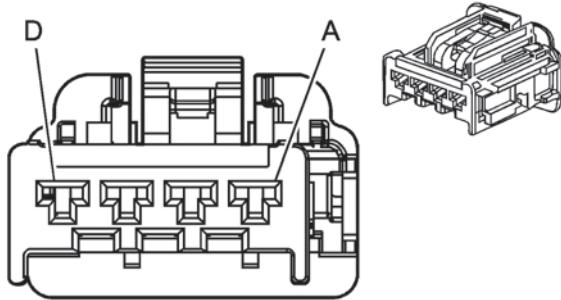

Battery power can be obtained from the main power feed at the side of the body fuse block under the driver seat.

## Battery Isolators

Battery isolation can be done in a number of ways. In this section we show you two ways that GM does it. On medium duty trucks we have a diode isolator component that places in line diodes in the battery charge lead going to the alternators. On CK trucks we have a relay isolation scheme. These drawings are provided to show you how you might accomplish your application.

## Charging System Description and Operation

### **Electrical Power Management Overview**

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems with the battery and generator. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the generator, to manage the load, improve battery state-of-charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by boosting idle speeds, and adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during ignition-off and during ignition-on. During ignition-off the state-of-charge of the battery is determined by measuring the open-circuit voltage. The state-of-charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state-of-charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. Throughout ignition-on, the algorithm continuously estimates state-of-charge based on adjusted net amp hours, battery capacity, initial state-of-charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state-of-charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state-of-charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

The Charging System Description and Operation is divided into 3 sections. The first section describes the charging system components and their integration into the electrical power management. The second section describes charging system operation. The third section describes the instrument panel cluster operation of the charge indicator, driver information center messages, and voltmeter operation.

## Charging System Description and Operation

### CHARGING SYSTEM COMPONENTS

#### **Generator**

The generator is a serviceable component. If there is a diagnosed failure of the generator it must be replaced as an assembly. The engine drive belt drives the generator. When the rotor is spun it induces an alternating current (AC) into the stator windings. The AC voltage is then sent through a series of diodes for rectification. The rectified voltage has been converted into a direct current (DC) for use by the vehicles electrical system to maintain electrical loads and the battery charge. The voltage regulator integral to the generator controls the output of the generator. It is not serviceable. The voltage regulator controls the amount of current provided to the rotor. If the generator has field control circuit failure, the generator defaults to an output voltage of 13.8 V.

#### **Body Control Module (BCM)**

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management (electrical power management) operation. The BCM determines the output of the generator and sends the information to the ECM for control of the generator turn on signal circuit. It monitors the generator field duty cycle signal circuit information sent from the ECM for control of the generator. It monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge. The BCM performs idle boost.

#### **Battery Current Sensor**

The battery current sensor is a serviceable component that is connected to the negative battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

#### **Engine Control Module (ECM)**

When the engine is running, the generator turn-on signal is sent to the generator from the ECM, turning on the regulator. The generator's voltage regulator controls current to the rotor, thereby controlling the output voltage. The rotor current is proportional to the electrical pulse width supplied by the regulator. When the engine is started, the regulator senses generator rotation by detecting AC voltage at the stator through an internal wire. Once the engine is running, the regulator varies the field current by controlling the pulse width. This regulates the generator output voltage for proper battery charging and electrical system operation. The generator field duty terminal is connected internally to the voltage regulator and externally to the ECM. When the voltage regulator detects a charging system problem, it grounds this circuit to signal the ECM that a problem exists. The ECM monitors the generator field duty cycle signal circuit, and receives control decisions based on information from the BCM.

(continued on next page)

## Charging System Description and Operation, cont'd.

### **CHARGING SYSTEM COMPONENTS, cont'd.**

#### **Instrument Panel Cluster**

The instrument panel cluster provides the customer notification in case a concern with the charging system. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM if equipped.

## Charging System Description and Operation

### CHARGING SYSTEM OPERATION

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode
- Charge Mode
- Fuel Economy Mode
- Headlamp Mode
- Start Up Mode
- Voltage Reduction Mode

The engine control module (ECM) controls the generator through the generator turn ON signal circuit. The ECM monitors the generator performance through the generator field duty cycle signal circuit. The signal is a pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes. The following table shows the commanded duty cycle and output voltage of the generator:

Commanded Duty Cycle	Generator Output Voltage
10%	11 V
20%	11.56 V
30%	12.12 V
40%	12.68 V
50%	13.25 V
60%	13.81 V
70%	14.37 V

The generator provides a feedback signal of the generator voltage output through the generator field duty cycle signal circuit to the ECM. This information is sent to the body control module (BCM). The signal is PWM signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-99 percent. Between 0-5 percent and 100 percent are for diagnostic purposes.

## Charging System Description and Operation, cont'd.

### CHARGING SYSTEM OPERATION, cont'd.

#### Battery Sulfation Mode

The BCM will enter this mode when the interpreted generator output voltage is less than 13.2 V for 45 minutes. When this condition exists the BCM will enter Charge Mode for 2-3 minutes. The BCM will then determine which mode to enter depending on voltage requirements.

#### Charge Mode

The BCM will enter Charge Mode when ever one of the following conditions are met.

- The wipers are ON for than 3 seconds.
- GMLAN (Climate Control Voltage Boost Mode Request) is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0°C (32°F).
- Battery State of Charge is less than 80 percent.
- Vehicle speed is greater than 145 km/h (90 mph)
- Current sensor fault exists.
- System voltage was determined to be below 12.56 V

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9-15.5 V, depending on the battery state of charge and estimated battery temperature.

#### Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the estimated battery temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is less than 15 amperes and greater than -8 amperes, and the battery state-of-charge is greater than or equal to 80 percent. Its targeted generator output voltage is the open circuit voltage of the battery and can be between 12.5-13.1 V. The BCM will exit this mode and enter Charge Mode when any of the conditions described above are present.

#### Headlamp Mode

The BCM will enter Headlamp Mode when ever the headlamps are ON (high or low beams). Voltage will be regulated between 13.9-14.5 V.

(continued on next page)

## Charging System Description and Operation, cont'd.

### **CHARGING SYSTEM OPERATION, cont'd.**

#### **Start Up Mode**

When the engine is started the BCM sets a targeted generator output voltage of 14.5 V for 30 seconds.

#### **Voltage Reduction Mode**

The BCM will enter Voltage Reduction Mode when the calculated ambient air temperature is above 0°C (32°F). The calculated battery current is less than 1 ampere and greater than -7 amperes, and the generator field duty cycle is less than 99 percent. Its targeted generator output voltage is 12.9 V. The BCM will exit this mode once the criteria are met for Charge Mode.

## Charging System Description and Operation

### INSTRUMENT PANEL CLUSTER OPERATION

#### Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a warning message in the driver information center if equipped, when the one or more of the following occurs:

- The engine control module (ECM) detects that the generator output is less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The instrument panel cluster determines that the system voltage is less than 11 V or greater than 16 V for more than 30 seconds. The instrument panel cluster receives a GMLAN message from the body control module (BCM) indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each ignition cycle. The indicator illuminates for approximately 3 seconds.

#### BATTERY NOT CHARGING SERVICE CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information center for the BATTERY NOT CHARGING SERVICE CHARGING SYSTEM message to be displayed. It is commanded ON when a charging system DTC is a current DTC. The message is turned OFF when the conditions for clearing the DTC have been met.

#### SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information center for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is commanded ON when a charging system DTC is a current DTC. The message is turned OFF when the conditions for clearing the DTC have been met.

## Fast Idle (UF3)

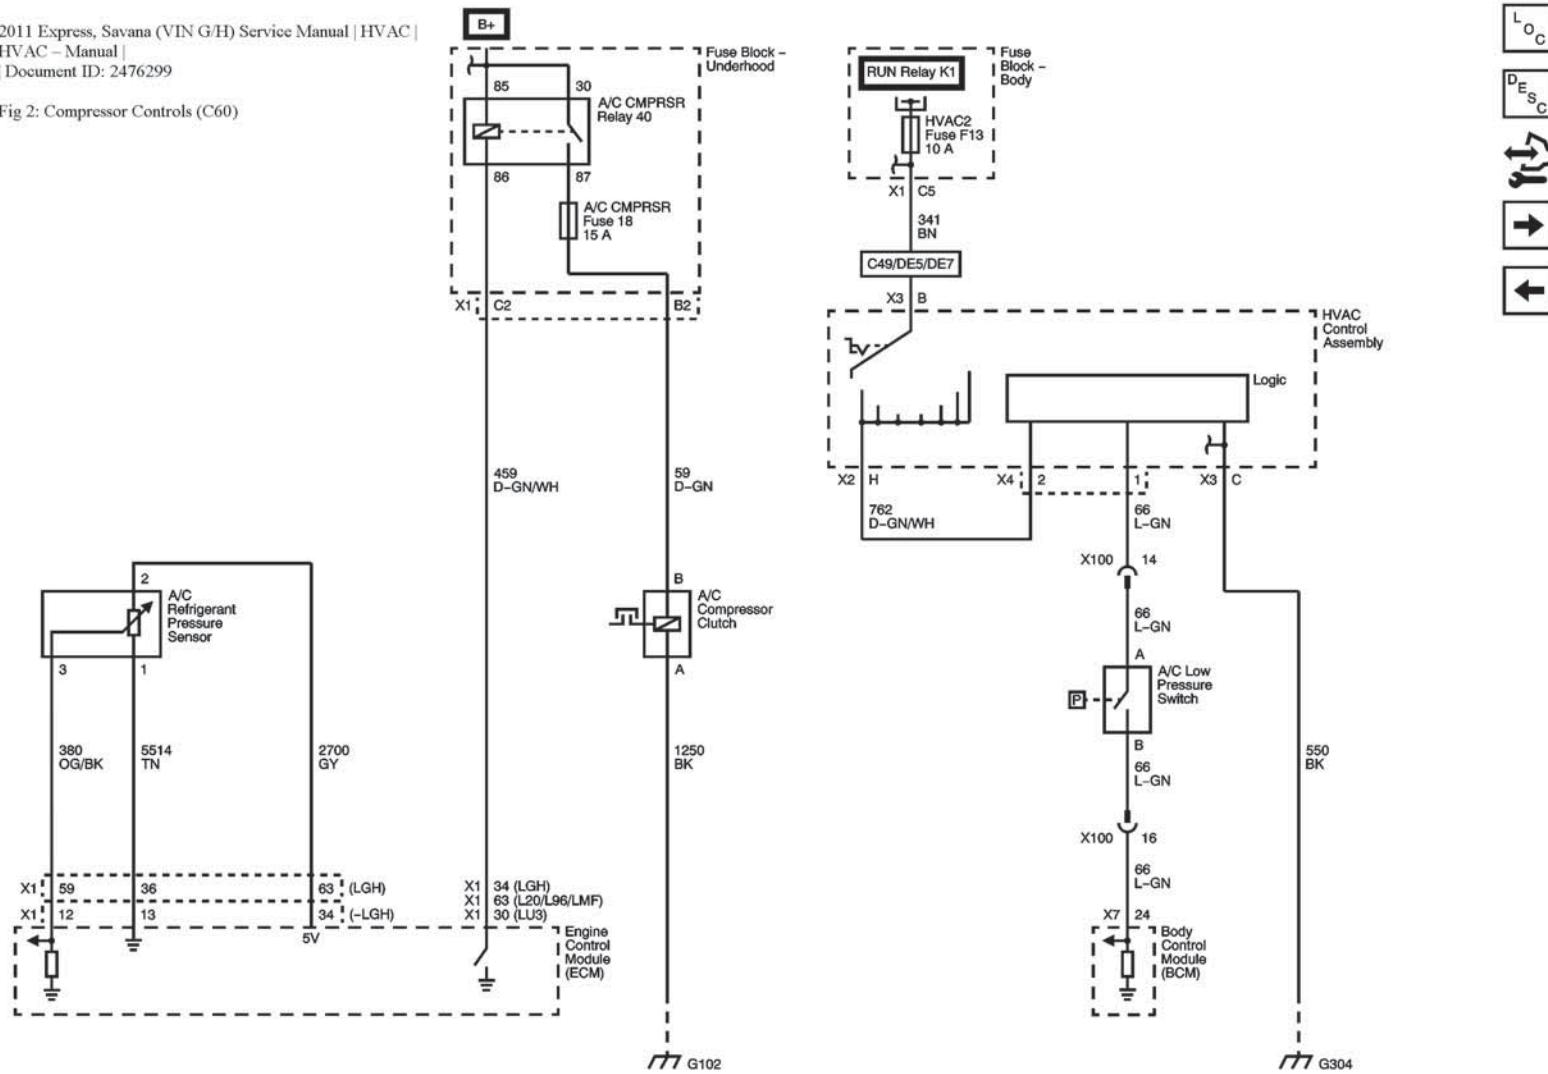

Engine idle up feature – option code UF3 – can be added on units with 6.0L gas or 6.6L Diesel engines and cruise control provided it was available on your model but not ordered. To assure availability for your model go to [www.gmupfitter.com](http://www.gmupfitter.com) and select ‘quick links’ then ‘GM Links’ then ‘On Line Order Guide’ and enter your vehicle information. Here is the link <http://eogld.ecomm.gm.com/dmdindex.htm>

## HVAC Compressor Control – Remote

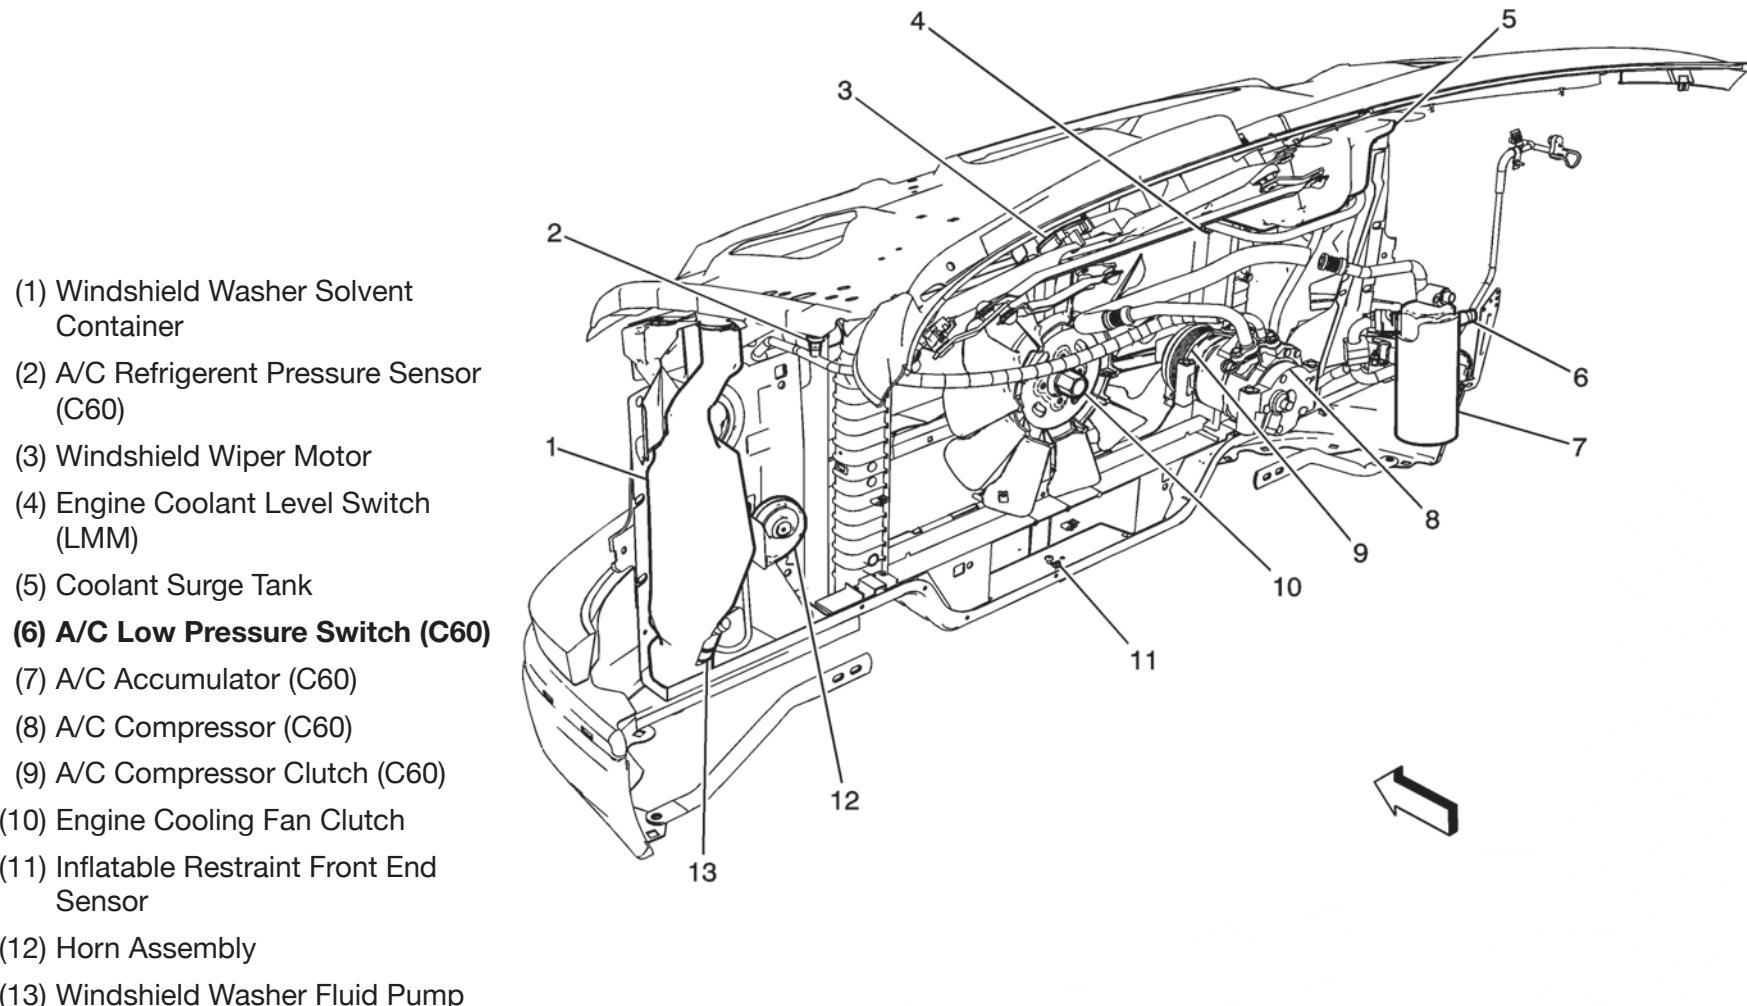

Remote control of the HVAC compressor can be accomplished by supplying a ground at the low pressure switch cavity A – see schematic and locator drawing.

## Front of Engine Compartment

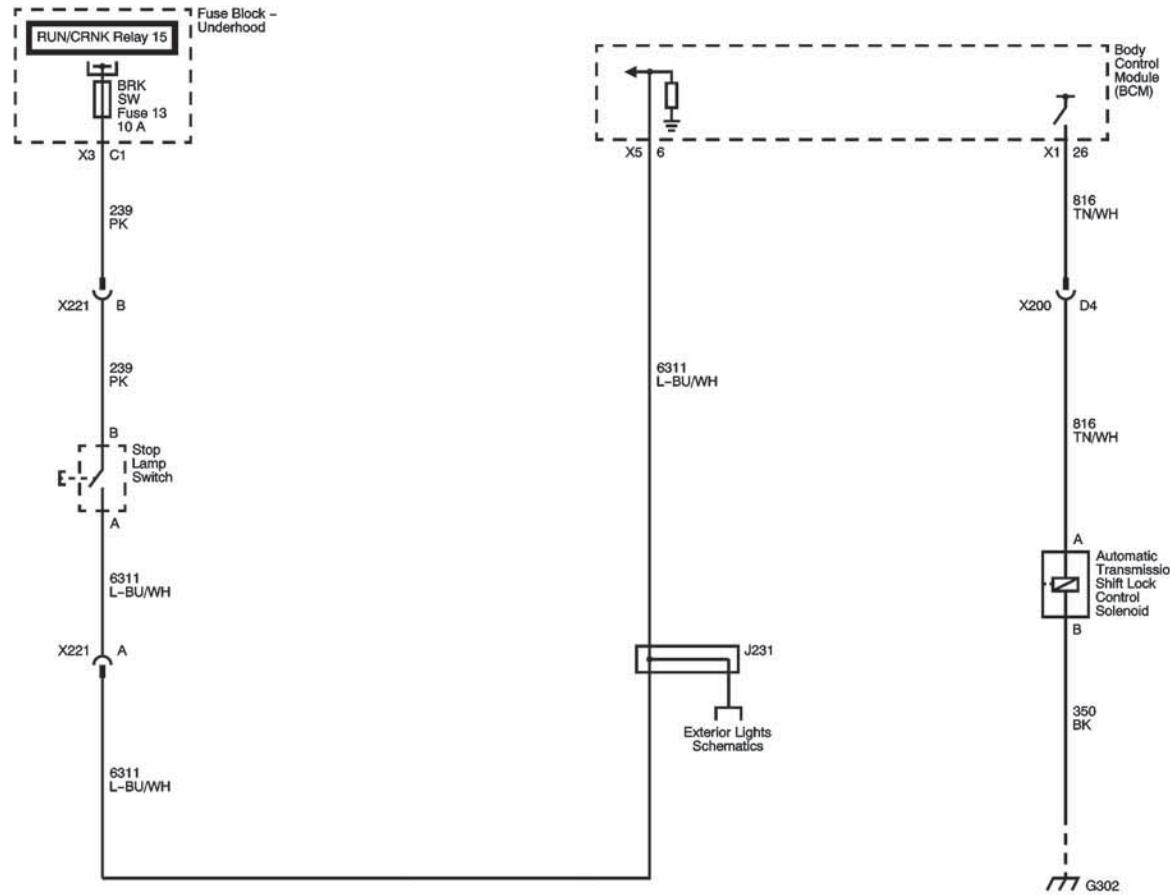

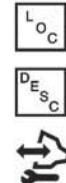

## Remote Vehicle Immobilizer

For applications where it is desirable to leave the vehicle running but assure that it can not be moved an external +12 v signal can be supplied to the shift interlock solenoid assuring the vehicle will remain in park – see schematic and location drawings. Best access is a the steering column connector X-200 cavity D4 tan white 816 wire.

## Separated Stop/Turn

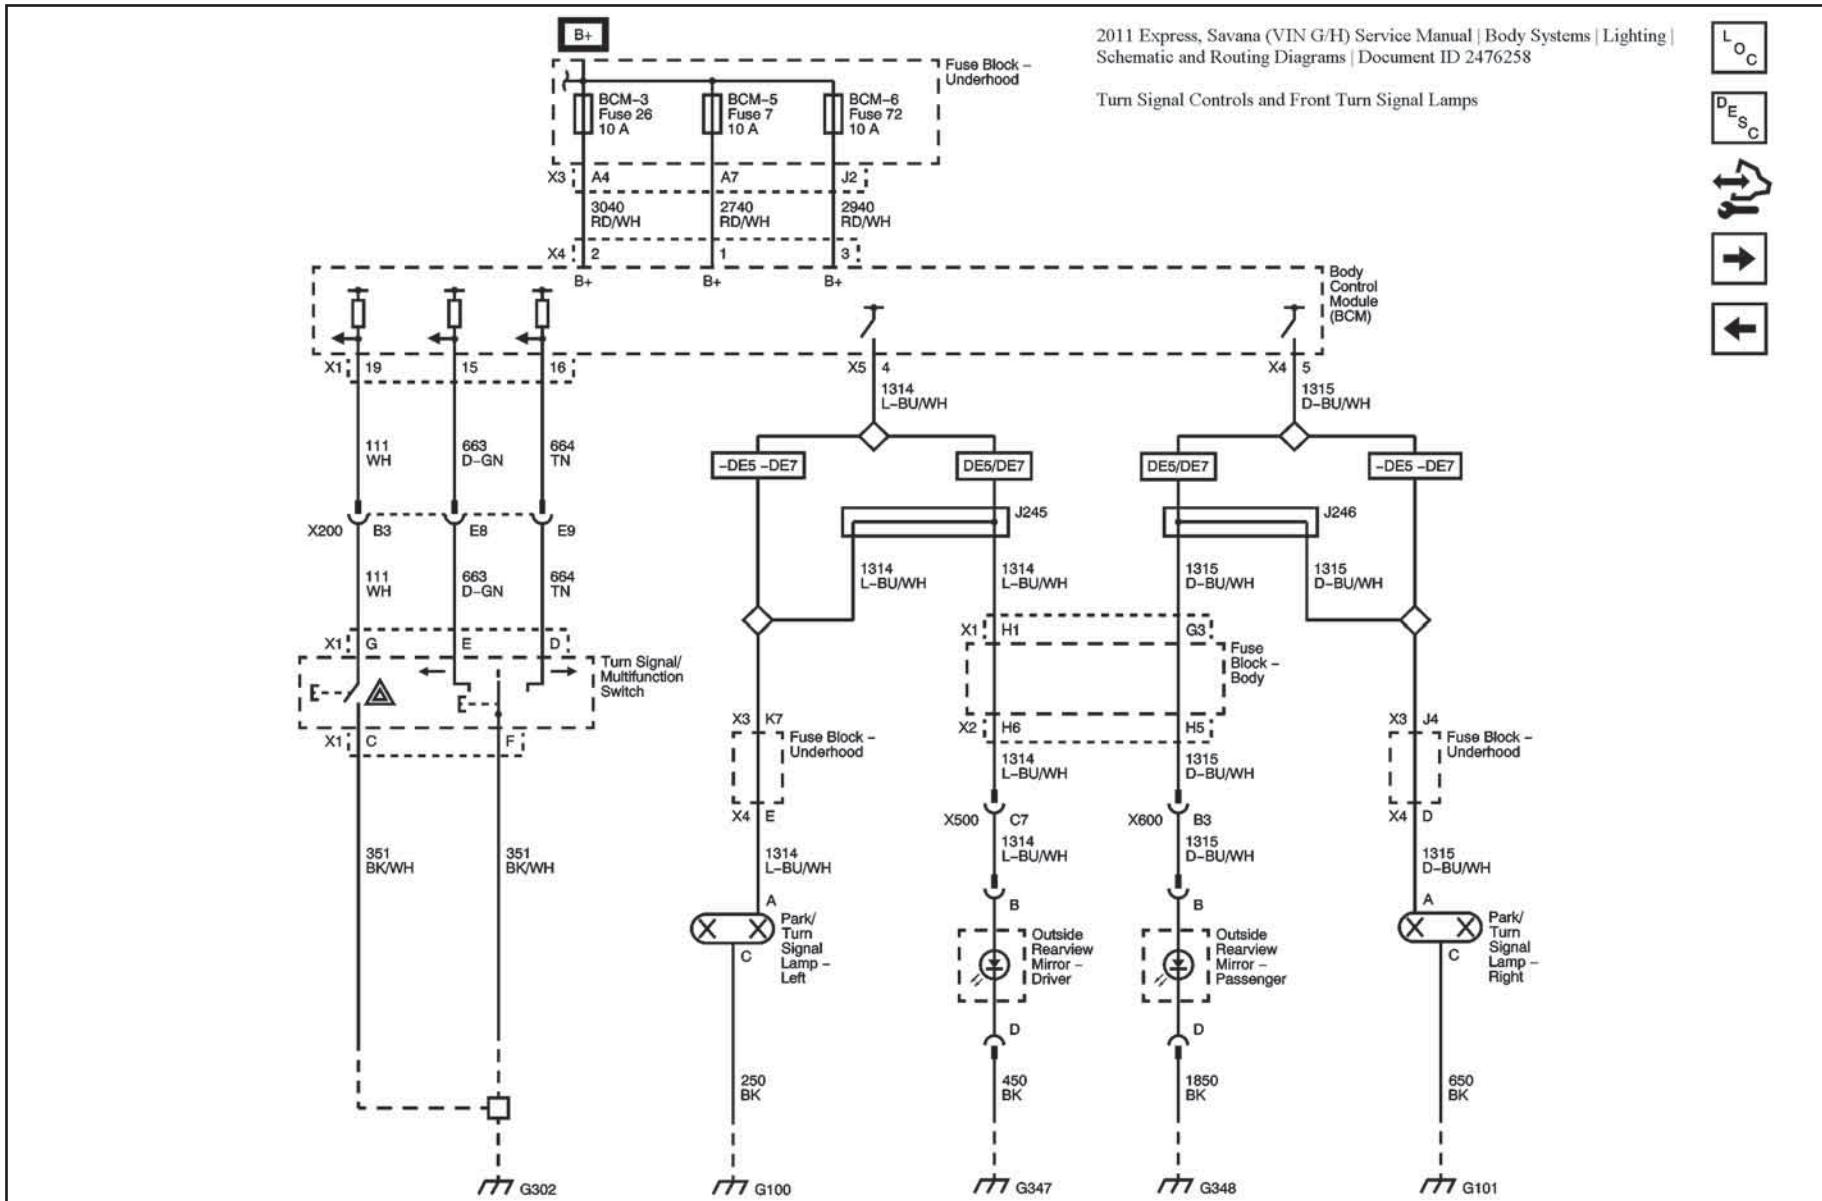

Separated stop and turn signals [at the rear lighting connector X405] are standard on all cutaway models. Option V4D provides both separated signals and LED compatibility [no fast flash for bulb outage detection ] on the rear signal lamps.

## Park Neutral Signal

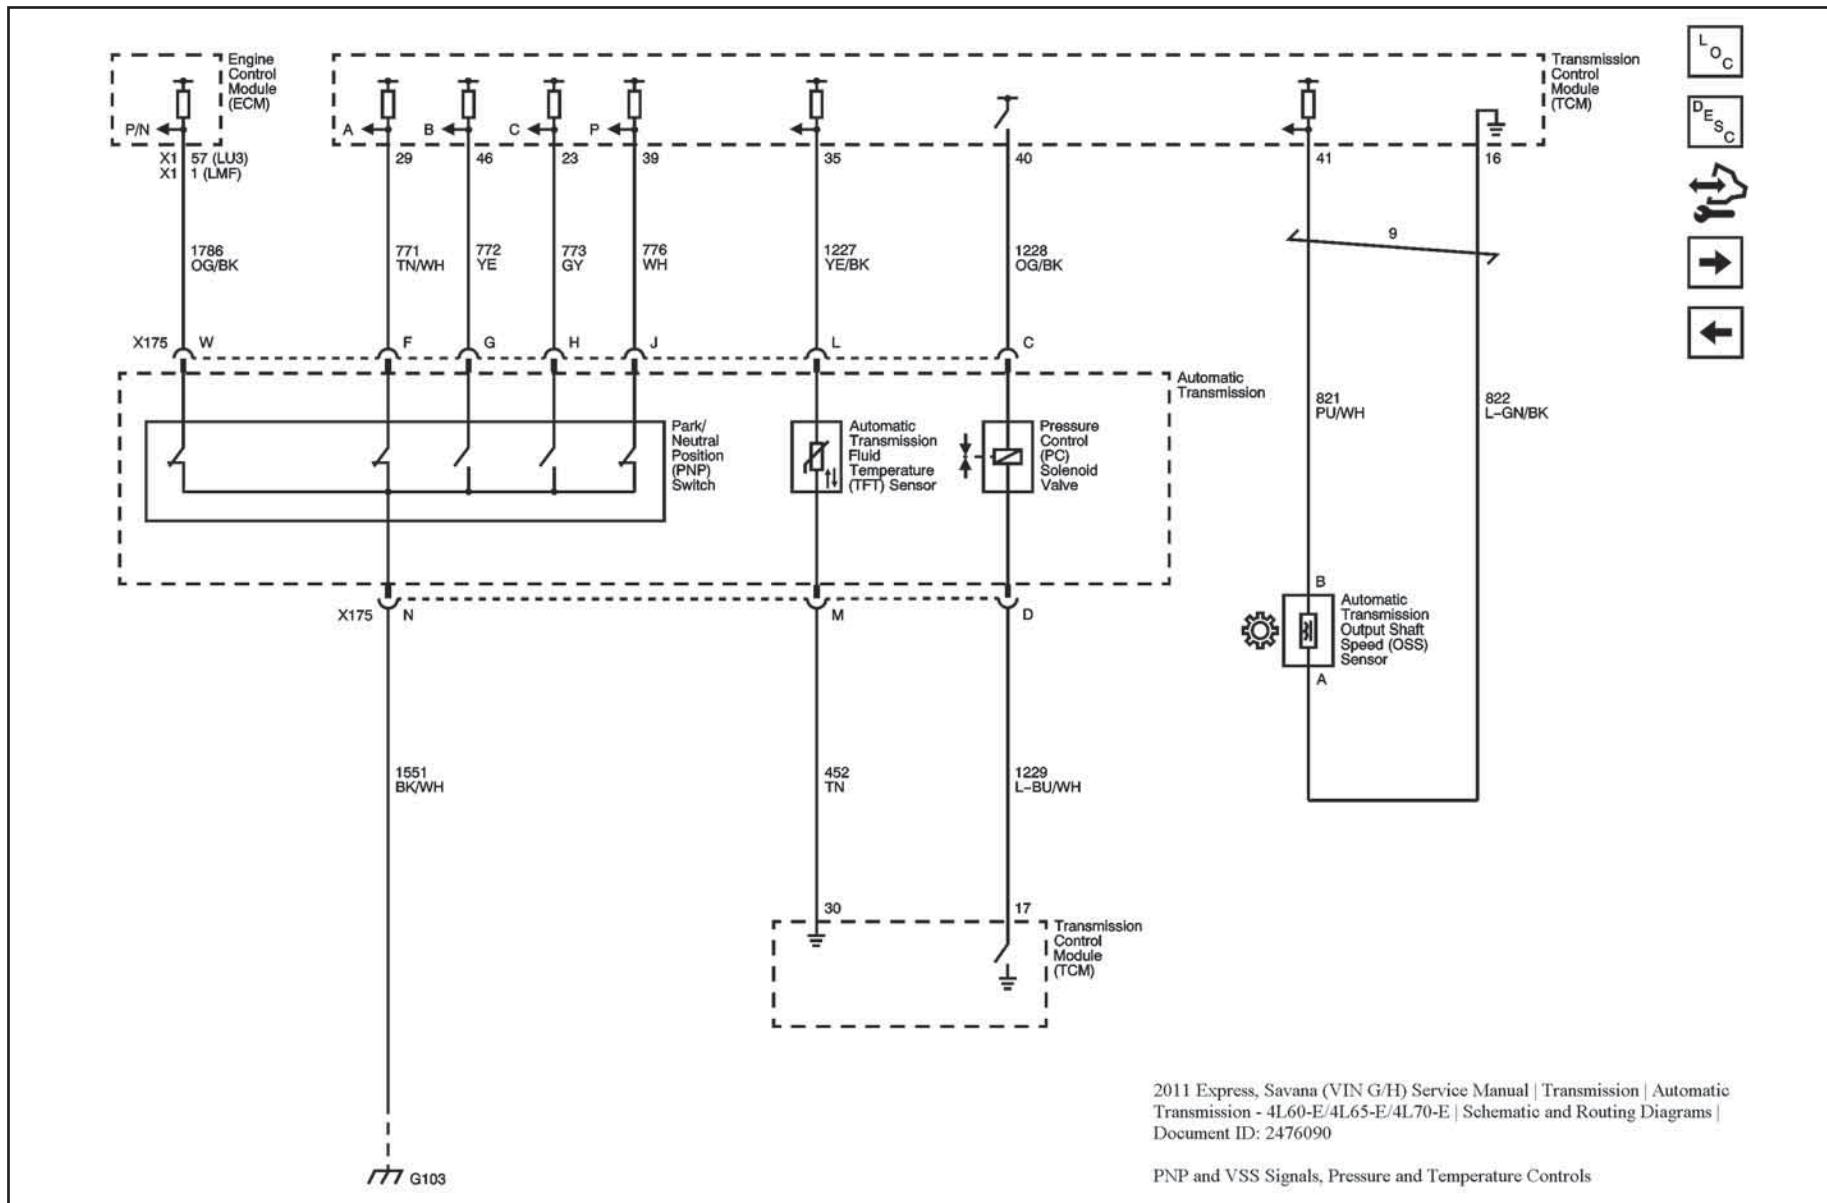

Park Neutral can be monitored in two ways.

1. The preferred method is to monitor the 816 tan white wire from the BCM which drives the shift lock solenoid. This signal goes to B+ when the ignition is ON and the vehicle is in Park. The BCM will drop power to this line when the brake is depressed. The 816 wire is in cavity D4 of X200.
2. When method 1 won't work there is a park/neutral switch in the transmission which supplies a ground signal directly to the engine controller. This is the 1786 orange black wire in the ECM connector [see ECM connector pin charts for specific pins based on engine type] which held low during park and neutral gear selections.

CAUTION: The PN switch or internal mode switch is very low current – intended to interface to a logic gate. You may NOT use it to close a relay unless the relay is very small with a coil current of less than 100 ma. It is best to detect this signal with a solid state gate which will have very small current draw. If you draw too much current from this circuit you will damage the switch and end up with a check engine light.

## Remote Start Stop

There is no OEM provision to remotely start and stop this vehicle. The best work around solution is to implement the wiring called out in the drawings GM Truck – CK GH Remote Crank and GM Trucks – CK GH – Engine Kill Sw. This method requires the key to be left in the ignition in the RUN position. If desired an interlock can be installed to immobilize the vehicle while in the remote modes. The schematic for this is in the Immobilizer quick reference.

## Trailer Wiring

If your vehicle does not have the trailer wiring provisions none of the relays and in cab wires will be present. The lamp driver circuits coming out of the Body Control Module BCM are not robust enough to handle the current requirements for a trailer plug. You will need to obtain control signals to operate power relays for each lighting function on your trailer plug. The coils of the power relays will be connected to the subject lamp circuit and ground such that the lamp signal will close the relay and allow the contacts to switch fused battery power to the appropriate trailer connector pin. Automotive rated relays must be used with noise suppression across the coils so noise spikes are not fed back into the OEM system. The rear lighting connector X405 contains all the lighting signals that will be required and the relay grounds may be connected to the cavity G black 150 wire. Your trailer plug ground must go to an appropriate body ground stud and may not be connected to the X405 ground.

If you are adding an aftermarket trailer brake controller to your vehicle you can use the CHMSL signal in X405-C [light blue 1320 wire] as your control signal for brake switch input to the controller. You will need to provide a power feed for the controller and if an ignition control input is required you can get that signal from any of the RUN/Crank fuses [see run/crank schematic] in the underhood fuse relay center

OEM: 13573920

Service: 15326956

Description: 16-Way M GT 280 Series (BK)

### Terminal Part Information

Pins: B-C, G, S

Terminal/Tray: 15304724/8

Core/Insulation Crimp: 2/A

Release Tool/Test Probe: J-38125-553/J-35616-5 (PU)

Pins: A, D-F, H-R

Terminal/Tray: 15304722/8

Core/Insulation Crimp: E/C

## X206 Body Harness to Front Headliner Harness (Passenger with C69)

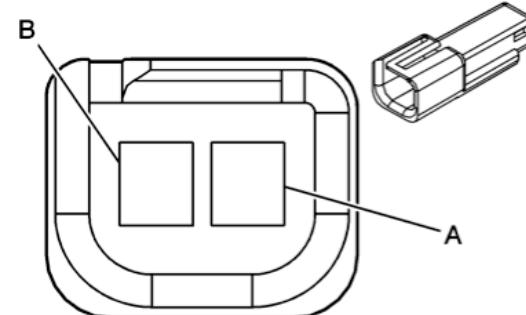

### Connector Part Information

Harness: Body  
OEM: 12047662  
Service: 12085535  
Description: 2-Way F Metri-Pack 150 Series (BK)

### Terminal Part Information

Terminal/Tray: 15326030/5  
Core/Insulation Crimp: E/C  
Release Tool/Test Probe: J-38125-12A/J-35616-14 (GN)

Pin	Wire	Circuit	Function
A	0.5 PU/WH	5265	Rear Auxiliary Mode Door Control
B	0.5 PK/BK	5264	Rear Auxiliary Blower Motor Switch Control

### Connector Part Information

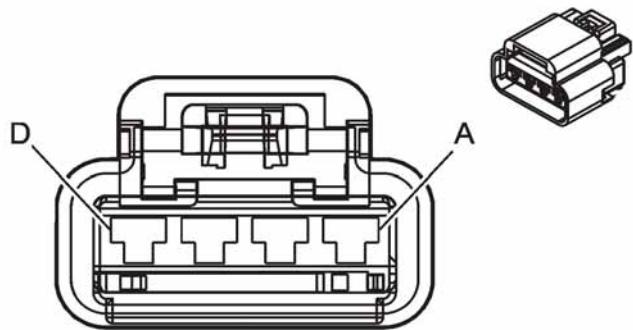

Harness: Front Headliner  
OEM: 12047663  
Service: 12085481  
Description: 2-Way M Metri-Pack 150 Series (BK)

### Terminal Part Information

Terminal/Tray: 12047581/2  
Core/Insulation Crimp: E/C  
Release Tool/Test Probe: J-38125-12A/J-35616-3 (GY)

Pin	Wire	Circuit	Function
A	0.5 PU/WH	5265	Rear Auxiliary Mode Door Control
B	0.5 PK/BK	5264	Rear Auxiliary Blower Motor Switch Control

## X221 Stop Lamp Switch Jumper to Instrument Panel Harness

### Connector Part Information

Harness: Stop Lamp Switch Jumper

OEM: 15326886

Service: 88988300

Description: 4-Way F GT 280 Series (BK)

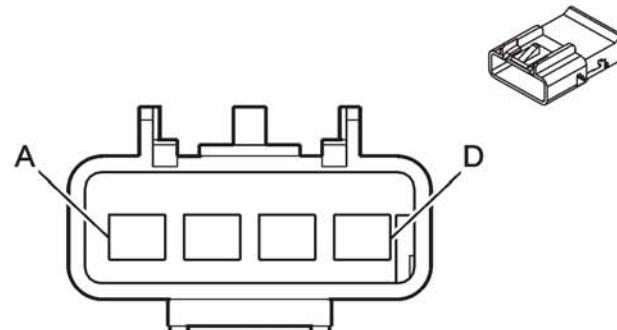

### Terminal Part Information

Terminal/Tray: 15304711/8

Core/Insulation Crimp: E/A

Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Pin	Wire	Circuit	Function
A	0.35 L-BU/WH	6311	Torque Converter Clutch (TCC) Brake Signal
B	0.35 PK	239	Ignition Voltage
C	0.35 OG/WH	812	12-Volt Reference
D	0.35 PU	7062	Brake Switch Signal

### Connector Part Information

Harness: Instrument Panel

OEM: 15326890

Service: 88953361

Description: 4-Way M GT 280 Series (BK)

## X405 Cutaway Rear Lighting Connector to Chassis Harness (Cutaway)

### Connector Part Information

Harness: Cutaway Rear Lighting Connector

OEM: 15326660

Service: 88986262

Description: 10-Way F GT 280 5.8 Series Sealed (BK)

- (2) Fuel Tank Pressure (FTP) Sensor Connector (Gas)

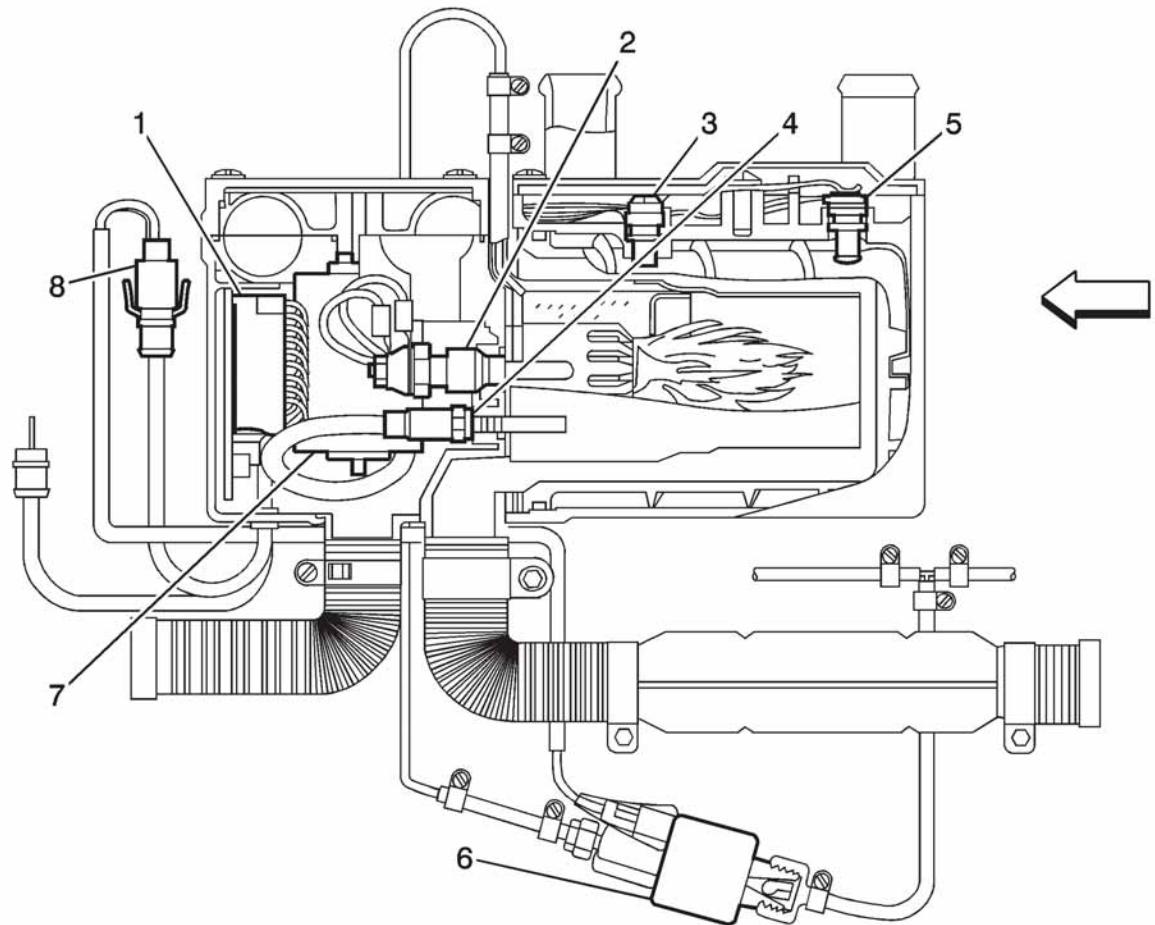

## Reductant Tank Components (LGH)

- (1) Reductant Sensor Module
- (2) Reductant Purge Solenoid Valve
- (3) Reductant Pump
- (4) Reductant Line Heater
- (5) Reductant Pressure Sensor
- (6) Reductant Tank Heater

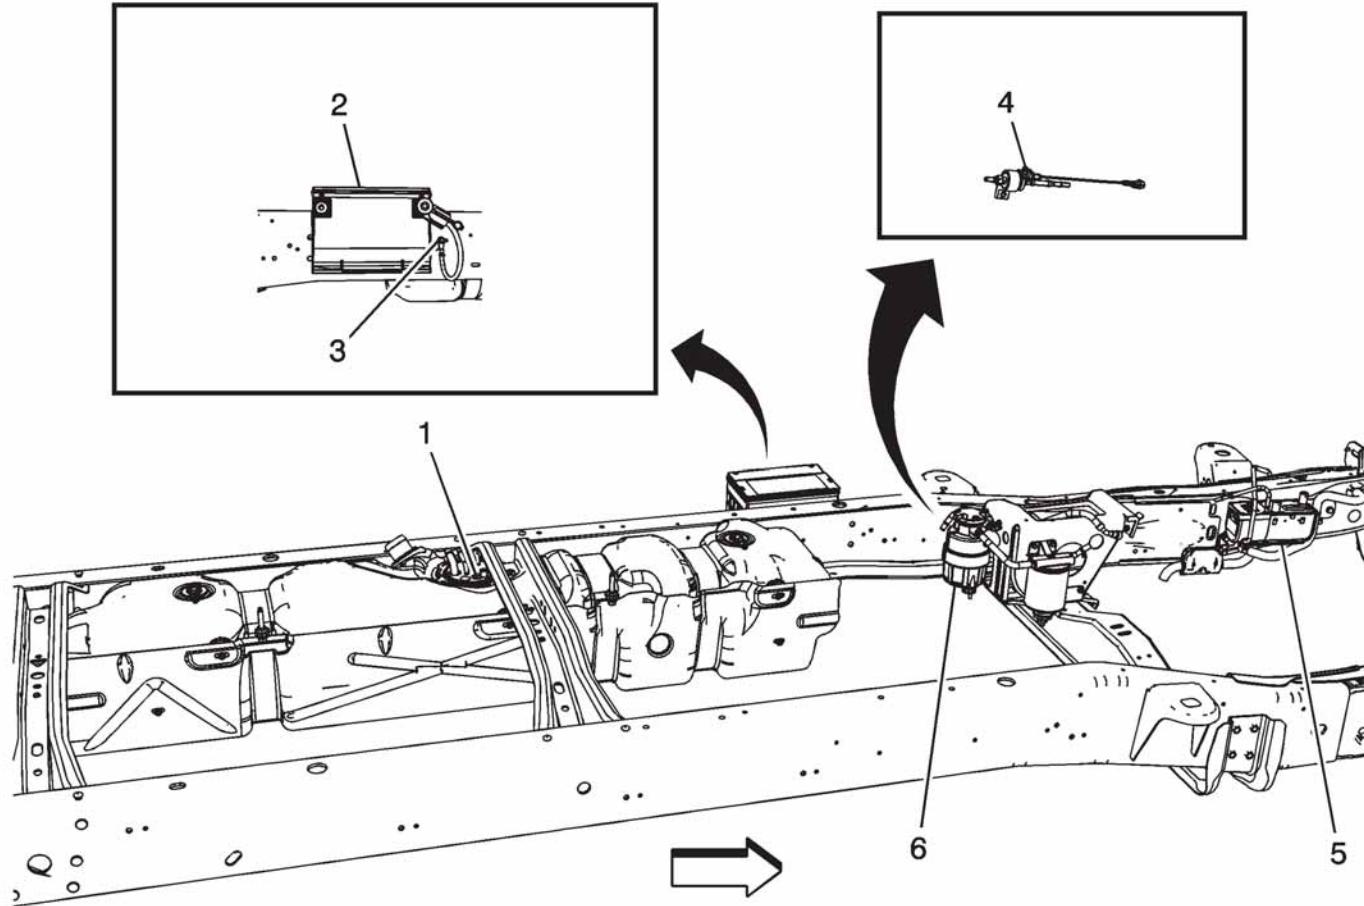

## Coolant Heater (K08)

- (1) Coolant Heater Control Module
- (2) Coolant Heater Glow Plug
- (3) Coolant Heater Air Temperature Sensor (Coolant Heater Temperature Sensor)
- (4) Coolant Heater Combustion Sensor
- (5) Coolant Heater Air Temperature Sensor (Coolant Heater Overheat Temperature Sensor)
- (6) Coolant Heater Fuel Pump
- (7) Coolant Heater Blower Motor
- (8) Coolant Heater Connector
