General Motors Upfitter Integration

BODY BUILDER MANUAL

ELECTRICAL SECTION

FOR THE

2017 CHEVROLET LOW CAB FORWARD MEDIUM DUTY 3500HD

Note to User:
As part of our mission to provide an up-to-date website that includes detailed Body Builder Manuals, Technical Bulletins, and Best Practice Manuals, we are now using sectional excerpts directly from the General Motors Service Information publications for our Electrical Body Builder Manuals.

You will note that the section numbers are non-sequential as we have provided only those that are believed to be the most pertinent to the Upfitter community and best suited to their needs.*

This new usage of the Service Information provides the opportunity for us to remain consistent with the changes that take place throughout the model year and to provide you updated information in a more timely fashion.

**** If you would like to have access to all of the electrical Service Information, please apply for a subscription from ACDelco at http://acdelcotechconnect.com/html/tss_tech_esi.jsp***

Cab and Chassis Electrical

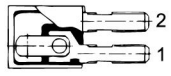
Cab and Chassis Electrical

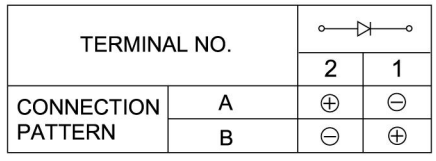
Specifications

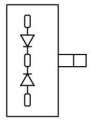
Battery Specifications

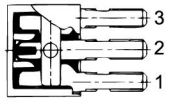
Application	Specification
Type	Delkor 31T – 750
Cold Crank Capacity	750 amp
Reserve Capacity (25 Amperes)	160 Minutes

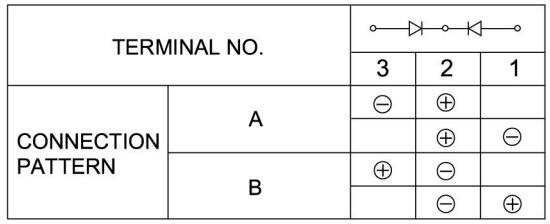
Diode Specifications and Configurations

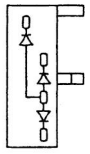
MARK	CONSTRUCTION	CHECKING (THERE SHOULD BE CONTINUITY IN EITHER A OR B WHEN A CIRCUIT TESTER IS CONNECTED WITH DIODE TERMINAL.)
						


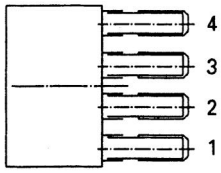


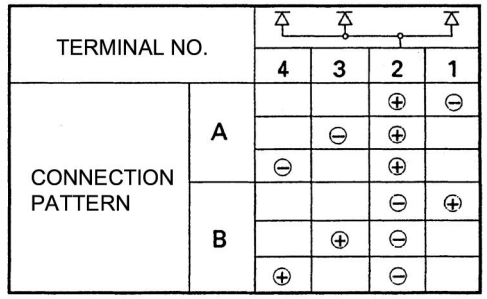












LNW780LF000601

Maximum Rating (Temp. = 25°C {77°F})

Items	Rating	Remarks
Peak Reverse Voltage	400V	—
Transient Peak Reverse Voltage	500V	—
Average Output Current	1.5A	Temp. = 40°C (104°F)
Working Ambient Temperature	-30°C – 80°C (-22°F – 176°F)	—
Storage Temperature	-40°C – 100°C (-40°F – 212°F)	—

Fuses

Reference Table of Fuse

Fuse No.	Capacity	Indication on Label	Main Parts(Load)
F-1	—	—	—
F-2	—	—	—
F-3	10A	ROOM LAMP,AUDIO	Audio, Data Link Connector, Dome Light
F-4	15A	DOOR LOCK	Door Lock Relay
F-5	15A	TRAILER BRAKE	Trailer Stop Relay
F-6	25A	P/WINDOW	Front Power Window RH Switch, Front Power Window LH Switch
F-7	10A	ABS	Electronic Hydraulic Control Unit (EHCU)
F-8	25A	WIPER	Wiper Main Relay, Wiper High Low Relay, Front Wiper Motor Front Washer Motor
F-9	10A	H/LAMP LO (LH)	Headlight LH, DRL Control Unit
F-10	10A	LMAPS (BATT)	DRL Relay, Headlight High Relay, Headlight Low Relay, Tail Relay
F-11	10A	H/LAMP LO (RH)	Headlight RH, DRL Control Unit
F-12	10A	BRAKE LAMPS	Stoplight Relay
F-13	10A	STARTER	P/N Start Relay
F-14	10A	H/LAMP HI (LH)	IP Cluster, Headlight LH, Headlight High Relay
F-15	10A	H/LAMP HI (RH)	Headlight RH,Headlight High Relay
F-16	15A	MIRROR HEATER	Blower Relay, Power Window Relay, Mirror Heater Switch
F-17	—	—	—
F-18	10A	IGNITION1	PTO Enable Relay, Intermittent Relay, Vacuum Pump Relay, Inhibitor Switch, Keyless Entry Control Unit
F-19	—	—	—
F-20	10A	ECM	Engine Control Module (ECM), Cruise Main Switch, Combination Switch Stoplight Switch
F-21	10A	METER	IP Cluster, Key On Relay, P/N Start Relay, TCM Relay Vacuum Pump Relay, Vehicle Speed Sensor, Flasher Unit Electronic Hydraulic Control Unit (EHCU), Cornering Light Relay PTO Switch 2
F-22	10A	ECU (BATT)	IP Cluster, Check Miles and Check Oil Level Switch, TCM Relay Transmission Control Module (TCM), Engine Control Module (ECM)
F-23	10A	MIRROR	Rear Body Switch, Rear Body Connector, MIMAMORI
F-24	15A	AUDIO, ACC	Audio, Cigarette Lighter Relay, Power ACC Relay
F-25	15A	HORN	Horn Relay

F-26	15A	TURN, HAZARD	Flasher Unit
F-27	10A	TAIL LAMPS	ID 1, ID 2, ID 3, Marker 1, Marker 2, Marker Light Relay Side Marker RH, Side Marker LH,
F-28	10A	ILLUMINATIONS	Check Miles and Check Oil Level Switch, Door Lock Switch, Audio Cigarette Illumination, Cruise Main Switch DPF Regeneration Switch, PTO Engine Speed Control Switch Mirror Heater Switch, Illumination Control Switch, Overdrive Off Switch IP Cluster, Hazard Switch, PTO Switch 2
F-29	10A	CORNERING LAMPS	Cornering Light Relay
F-30	10A	AIR CONDITIONER	Blower Relay, Blower Motor, Magnetic Clutch Relay Defroster Switch, A/C Switch
F-31	20A	MARKER LAMP	Marker Light Relay
F-32	20A	TAIL MAIN	Tail Relay
F-33	15A	FUEL HEATER	Fuel Heater
F-34	20A	SCR	Diesel Exhaust Fluid (DEF) Control Module, Heater Valve Relay, NOx and Diesel Exhaust Fluid (DEF) Sensor Relay
F-35	15A	PM SENSOR	PM Sensor, Glow Plug Control Module
F-36	15A	RR DOME LIGHT	Rear Manufacture Connector
F-37	20A	CONDENSER FAN	Condenser Fan Relay
F-38	10A	AIR CONDITIONER	Magnetic Clutch Relay
F-39 (D-1)	20A	CIGAR	Cigarette Lighter
F-40 (D-2)	15A	ACCESSORIES SOCKET	ACC Socket
F-41 (D-3)	20A	POWER SOURCE	Power Source

Diagnostic Information and Procedures

General Electrical Diagnosis

Caution: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque values must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

The chassis electrical system is of 12-volt specifications with a negative ground polarity.

Wire sizes are appropriate to respective circuits, and classified by color. (The classification of harnesses by color is shown on the circuit diagram for ease of harness identification.)

The wire size is determined by load capacity and the length of wire required.

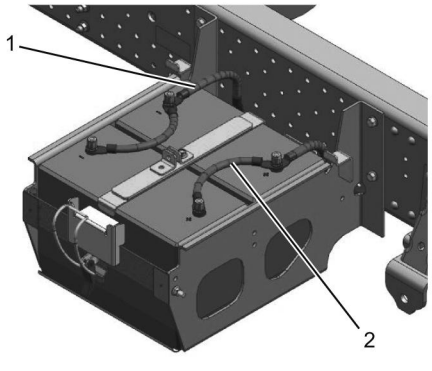
The vehicle harnesses are: body harness, floor harness, engine harness, frame front harness, frame rear harness, rear body harness, dome light harness, door harness and battery cable.

The harnesses are protected either by tape or corrugated tube, depending on harness location.

The circuit for each system consists of the power source, wire, fuse, relay switch, load parts and ground, all of which are shown on the circuit diagram.

In this manual, each electrical device is classified by system. For major parts shown on the circuit based on the circuit diagram for each system, a summary, diagnosis of troubles, inspection and removal and installation procedures are detailed.

Notes for Working on Electrical Items



LNWH80SH000301

Disconnecting the Battery Cable

1. All switches should be in the "LOCK" position.

Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

2. Disconnect the battery ground cable (1).

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.

3. Disconnect the battery positive cable (2).

   Note: It is important that the battery ground cable be disconnected first. Disconnecting the battery positive cable first can result in a short circuit.

Connecting the Battery Cable

Follow the disconnecting procedure in the reverse order.

Note: Clean the battery terminal and apply a light coat of grease to prevent terminal corrosion.

Battery Diagnosis

Visual Inspection

- Battery case or cover for cracks or breaks that could permit loss of electrolyte. Replace the battery if badly damaged, determine the cause of the damage, and correct as needed.

Hydrometer Check

Green Dot Visible

If the hydrometer has a GREEN DOT visible, the battery is ready for testing. Proceed to “Load Test” later in this section.

Green Dot not Visible or Dark

Charge the battery as outlined under the heading “Battery Charging Procedure” later in this section.

Light or Bright Indicator; Illustrated as “CLEAR”

Do not charge, test or jump start the battery.

Replace the battery.

Load Test

Top Terminal Batteries

If there is more than one battery in the vehicle, check each battery separately after disconnecting them from each other.

1. Remove battery cables from battery terminals and proceed as follows:
2. Attach terminal hex nuts, required for testing and charging as shown in figure below.

   Note:

   - The alligator clamps of the tester or charger should be placed between the terminal nuts and the lead pads of the terminal studs as shown in figure 5. If the tester clamps cannot be attached between nuts and lead pads of the terminals, the load value of “Load Test” should be 210 amperes.
3. Connect a voltmeter and a battery load tester across the battery terminals.
4. Remove the surface charge from all batteries that have been on charge IF THE GREEN HYDROMETER DOT IS VISIBLE. This includes batteries in the vehicle having been charged by the vehicle generator.

   Do not remove surface charge from batteries that have been in storage. To remove surface charge, apply a 300-ampere load across the terminals for 15 seconds. Then turn off load and wait for 15 seconds to allow the battery to recover.

   Voltage and Temperature Chart :

   Degrees Temperature

   - 21°C (70°F) and Above; 9.6 minimum voltage
   - 10°C (50°F); 9.4 minimum voltage
   - -1°C (30°F); 9.1 minimum voltage
   - -10°C (14°F); 8.8 minimum voltage
   - -18°C (0°F); 8.5 minimum voltage
5. If battery voltage does not drop below the minimum voltage as shown in the previous “Voltage and Temperature Chart,” the battery is good and should be returned to service. (The battery temperature must be estimated by feel and by the temperature the battery has been exposed to for the preceding few hours.) If battery voltage drops below the minimum voltage listed, replace the battery.

Battery Charging

Battery Charging Procedure and Rules

The following basic rules apply to any sealed battery charging situation:

1. Do not charge a battery if the hydrometer is clear or light yellow – replace the battery.
2. Charge rates between three and fifty amperes are satisfactory as long as spewing of electrolyte does not occur or the battery does not feel excessively hot (over 52°C (125°F)).

   If spewing occurs or temperature exceeds 52°C (125°F), the charging rate must be reduced or temporarily halted to permit cooling.
3. The battery is sufficiently charged when the green dot in the built-in hydrometer is visible. No further charging is required. Shake or tilt the battery at hourly intervals during charging to mix the electrolyte and see if the green dot appears.
4. Battery charging consists of a charge current in amperes for a period of time in hours. Thus a 25-ampere charging rate for two hours would be 50 ampere-hour charge to the battery. In most cases, batteries whose load test values are less than 200 amperes will have the green dot visible after least a 50 ampere-hour charge. Most batteries whose load test values are greater than 200 amperes will have the green dot visible after at least a 75 ampere-hour charge. In the event that the green dot does not appear, after this amount of charging, continue charging for another 50 to 75 ampere-hours. If the green dot still does not appear, replace the battery.
5. The time required for a charge will vary because:

   - Size of Battery – Example: A completely discharged large heavy-duty battery requires more than twice the recharging as a completely discharged small passenger car battery.
   - Temperature – Example: A longer time will be needed to charge any battery at -18°C (0°F) than at 27°C (80°F). When a fast charger is connected to a cold battery, the current accepted by the battery will be very low at first, then in time the battery will accept a higher rate as it warms up.
   - State of Charge – Example: A completely discharged battery requires more than twice as much as a half-charged battery. Because of a completely discharged battery the electrolyte is nearly pure water and a poor conductor, thus current flow accepted is very low at first. As the charging current causes the electrolyte acid content to increase, the charging current will likewise increase.
   - Charger Capacity – Example: A charger that can supply only 5 amperes will require a much longer period of charging than a charger that can supply 30 amperes or more.

Battery Cables

Excessive resistance caused by poor terminal connections and partial short circuits through defective cable insulation will result in abnormal voltage drop in the starter cable. Low voltage at the starter will cause hard starting.

Note: To prevent the vehicle from moving and the engine from starting while performing these checks, engage the parking brake and place the transmission in “Neutral” position.

On diesel engines, disconnect the battery feed terminal connector at the fuel shutoff valve, or pull the “Engine Stop” knob out, as equipped.

Measure

1. Voltage drop between negative (–) battery terminal and vehicle frame.
   - Place one prod of test voltmeter on grounded battery post (not on cable clamp) and the other on frame. Operate starter and note the voltage reading.
2. Voltage drop between the positive (+) battery terminal and starter terminal stud with starter operating.
3. Voltage drop between starter housing and frame with starter operating.

   If the voltage drop in any of the above is more than 1.0 volt, there is excessive resistance in the circuit. To eliminate resistance, the cables should be disconnected and connections cleaned. If cables are frayed or the clamps excessively corroded, the cables should be replaced. When selecting new cables, be sure they are at least as large as the ones being replaced.

Jump Starting

If vehicle has a discharged battery, it can be started by using energy from another battery – a procedure called “jump starting.”

Warning: The instructions below must be followed exactly or personal injury (particularly to eyes) or property damage may result from battery explosion, battery acid, or electrical (short circuit) burns. The major safety precaution is to make the final connection to ground on the engine at some distance from the battery. This helps reduce the chance of an explosion due to sparks. To lessen the chance of an explosion, never expose the battery to open flames or electric sparks. Do NOT smoke near the battery. Batteries give off a gas that is flammable and explosive. To lessen the risk of injury in case an explosion does occur, wear eye protection or shield your eyes when working near any battery. Do NOT lean over a battery. Do NOT allow battery fluid to contact eyes, skin, fabrics, or painted surfaces because battery fluid is a corrosive acid. Flush any contacted area with water immediately and thoroughly. Also get medical help if eyes are affected. To lessen the risk of a short circuit, remove rings, metal watch bands and other metal jewelry. Do NOT allow metal tools to contact the positive battery terminal (or metal in contact with it) and any other metal on the vehicle. Be certain when attaching the jumper cable clamps to the positive terminals of the batteries that neither clamp contacts any other metal.

1. This vehicle has a 12-volt starting system and a negative ground electrical system. Be sure that the other vehicle also has a 12-volt starting system and negative ground. Its owner’s manual may give you that information.

   IF YOU ARE UNSURE OF THE OTHER VEHICLE’S VOLTAGE (OR IF THE VOLTAGE AND GROUND ARE DIFFERENT FROM YOUR VEHICLE), DO NOT TRY TO JUMP START, AS PERSONAL INJURY OR SEVERE DAMAGE TO ELECTRICAL AND ELECTRONIC PARTS MAY RESULT.

   Because of the extra torque needed to start many diesel engines, diesel powered vehicles often have more than one battery. While it is possible to use the procedure described here to jump start a single-battery vehicle from a vehicle with more than one battery, the opposite may not be true. For example, at low temperature it may not be possible to start a diesel engine. Never connect “+” (red) to “-” (black), or “-” to “+”.
2. Position the vehicle with the good (charged) battery so that the jump starting cables will reach. DO NOT ALLOW THE VEHICLES TO TOUCH.
3. Turn off all electrical motors and accessories in both vehicles. Turn off all lights except those needed to protect the vehicle or light up the work area. Turn off the ignition, apply the parking brake firmly. If the vehicle(s) have an automatic transmission, shift to “PARK” (if no “PARK” position, shift to “NEUTRAL”. If the vehicle(s) has a manual transmission, shift to “NEUTRAL”. Do this in both vehicles. For vehicles with AC wheel lock control, refer to step 10.
4. If the discharged battery has filler caps, check the fluid level. DO NOT CHECK NEAR AN OPEN FLAME AND DO NOT SMOKE. Add clear drinking water to the proper level if low, and replace caps before jump starting.
5. Connect the first jumper cable from positive “+” (red) terminal on one battery to the “+” (red) terminal on the other battery. Never connect “+” (red) to “-” (black), or “-” to “+”.
6. Connect one end of the second cable to the grounded negative “-” (black) terminal of the good (charged) battery.
7. Connect the other end of the second jumper cable to a solid, stationary, metallic point on the engine of the vehicle with the discharged battery but at a point AWAY FROM THE BATTERY, 450 mm (18 in) or more from the

battery if possible. Do not connect it to pulleys, fans, or other parts that will move when the engine is started.

Do not touch hot manifolds as they can cause severe burns. If hot or moving parts can be avoided, the MOUNTING BRACKETS for the generator, or the air conditioning compressor, generally make a good point for this final ground attachment point. Take care that the jumper cable does not contact moving parts on or near the generator or compressor.

8. Start the engine on the vehicle with the good (charged) battery and run the engine at a moderate speed.

9. Start the engine of the vehicle that has the discharged battery.

10. Jump Starting – AC Wheel Lock Controls – if it is necessary to jump start the vehicle from a booster battery, the circuit boards in the wheel lock control may be damaged. In order to avoid this condition, the following procedure should be used for jump starting vehicles equipped with wheel lock control:

10.1. Connect the jumper cables between the booster battery and the discharged vehicle battery, per normal recommended procedures.

10.2. Start the vehicle per normal procedures.

10.3. Turn on major electrical accessories including lights and heater blower.

10.4. Disconnect the jumper cables from the vehicle battery per normal procedures.

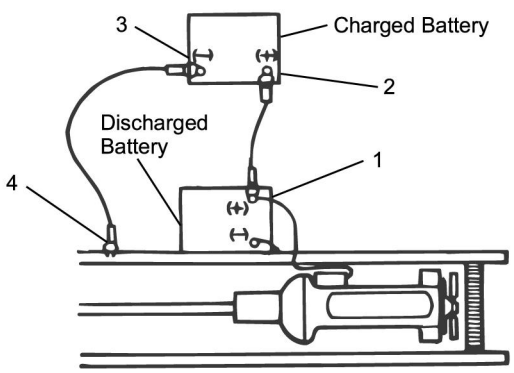
The above procedure allows the transient energy to be dissipated through several circuits rather than having it all flow through the wheel lock control system.

11. Remove the battery cables by reversing the connecting sequence exactly. Begin by removing the last clamp first; that is, remove the jumper cable from the engine of the vehicle with the discharged battery as the first step.

Note: Make connections in numerical order.

Do not allow the vehicles to touch.

Make last connection on frame away from the battery.



LNW46DSH002901

Battery Replacement

When handling a battery, the following safety precautions should be observed:

1. Hydrogen gas is produced by the battery. A flame or spark near the battery may cause the gas to ignite.
2. Battery fluid is highly acidic. Avoid spilling on clothing or other fabric. Any spilled electrolyte should be flushed with large quantities of water and cleaned immediately.

Removal Procedure

Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

1. Remove the battery ground cable from negative terminal.

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.
2. Remove the battery positive cable from positive terminal.
3. Remove the battery hold-down clamp.
4. Remove the battery.

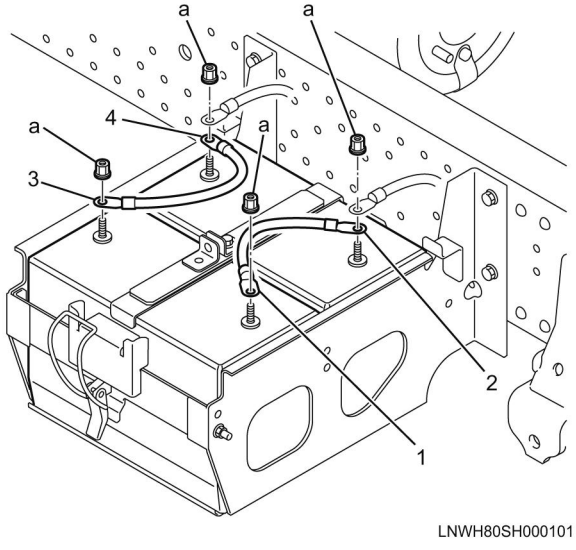
Inspection Procedure

Inspect the battery for physical damage, such as a cracked top or battery case, and correct.

Installation Procedure

1. Install the battery.
   1.1. Draw down the hold-down clamp, being careful not to distort or crack the case or cover.
   1.2. Check polarity to be sure the battery is not revered with respect to the generator.
2. Install the battery positive cable to positive terminal.
3. Install the battery ground cable to negative terminal.

   Tighten the battery cables to the battery.

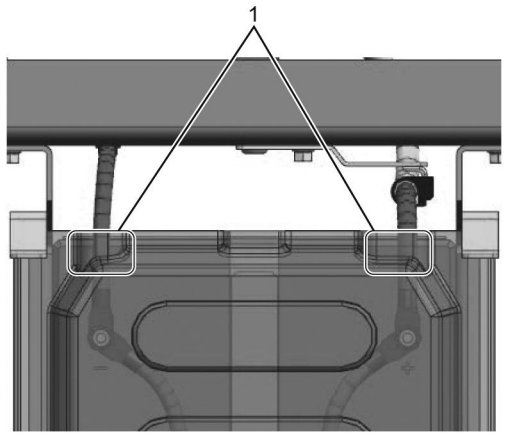


LNWH80SH000101

Note: Fix terminals to the plus side in order as follows.

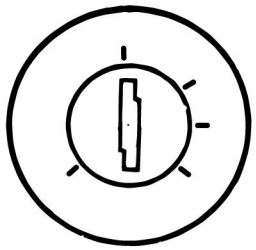
CABLE ASM; BAT TO BAT — CABLE ASM; BAT POS — HARNESS TERMINAL

4. Fix terminals of cable (+), (−) straight to match the opening part of battery cover (1).



LNWH80SH001301

Ignition and Start Switch Replacement



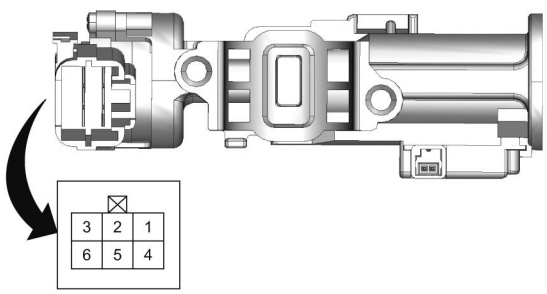
LNW780SH011701

The ignition switch positions are LOCK, ACC, ON and START. Turning the starter key to these positions a circuit for starting the engine, the operation of accessories, or stop the engine.

Inspection Procedure

Check the continuity between the ignition connector terminals.

Repair or replace the switch when the result of inspection is found abnormal.



Switch Position \ Terminal No.	4	5	6	1	2	3
	B1	ACC	IG1	IG2	ST	B2
LOCK						
ACC	○—○					
ON	○—○	○—○		○		○
START	○		○		○—○	

LNWG9CSH000101

Removal Procedure

Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

1. Disconnect the battery ground cable.

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.

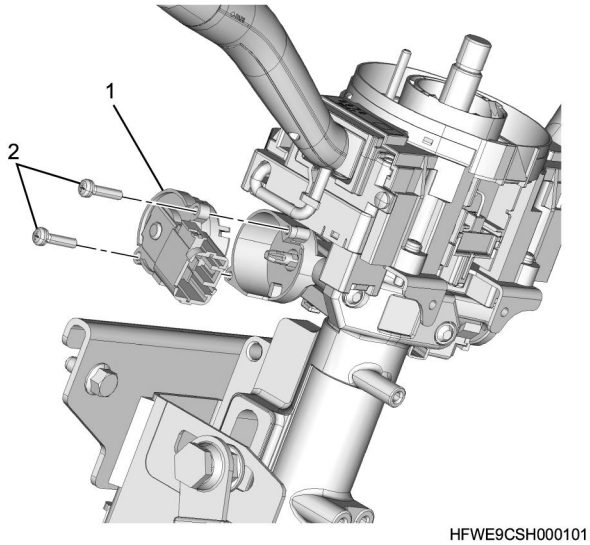
2. Remove the steering cowl.

   Refer to the CELL Link Error - Link target cell (cell ID 280895) is invalid for this publication..

3. Remove the ignition switch (1).

   3.1. Disconnect the connector.

   3.2. Remove the screws (2).



HFWE9CSH000101

Installation Procedure

To install, follow the removal steps in the reverse order.

Description and Operation

Exterior Lights Circuit Description

The circuit consists of lights (headlight, side marker light, clearance light, parking light, turn signal light [front, side and rear], cornering light, identification light, stoplight, taillight, backup light and license plate light), switches (ignition switch, combination switch, hazard warning switch, illumination control switch, brake switch, backup light switch and inhibitor switch), relays and other units.

The circuit has the DRL (Daytime Running Light) function. The DRL unit lights up the headlight automatically when the engine is running and the parking brake is released. When the lighting switch is turned to the headlight ON position, the DRL unit turns OFF the headlight.

The combination switch consists of the lighting switch, the dimmer switch and the turn signal switch. The each of lights are operated by the combination switch or other switches.

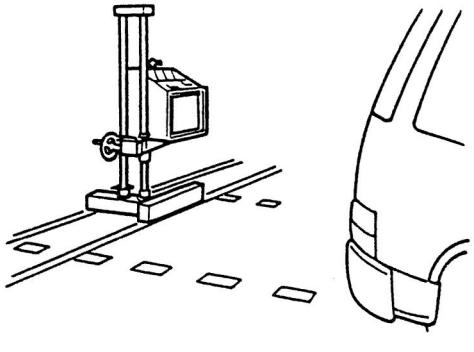
Repair Instructions

Headlamp Aiming

Aiming of Headlight

Place the unloaded vehicle on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, and the battery is sufficiently charged. Adjust the aim with the headlight tester.

When adjusting, follow the procedure of the tester manufacturer.

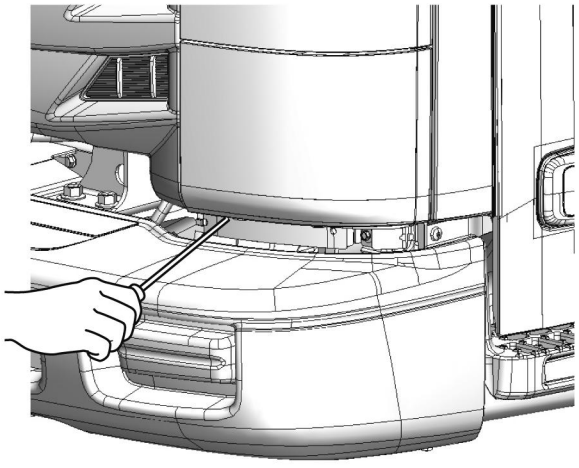


LNW38ASH006101

Vertical Adjustment

Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until entering the space between teethe of the adjusting screw. Turn the gear wheel to adjust headlight focus up or down.

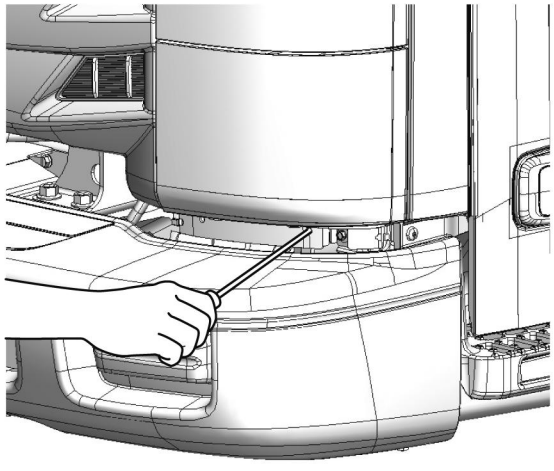
Two vertical aim gear wheels should be turned in the same direction at the same time to adjust aiming.



LNWG9ASH000401

Horizontal Adjustment

Insert the tip of a screwdriver into the hole beneath the headlight (the shaft of the screwdriver must be slanted up) until entering the space between teethe of the adjusting gear wheel. Turn the gear wheel to adjust headlight focus to the left or right.



LNWG9ASH000501

Front Turn Signal Lamp Bulb Replacement

Removal Procedure

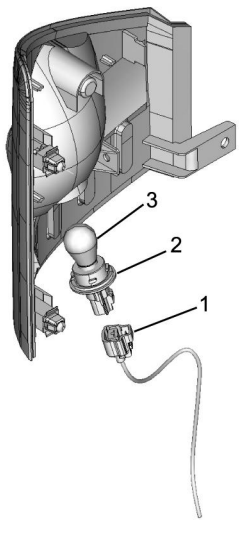
Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

1. Disconnect the battery ground cable.

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.

2. Remove the front turn signal light. Refer to Front Turn Signal Lamp Replacement.
3. Remove the front turn signal light bulb.
   - **3.1.** Remove the front turn signal light harness connector (1).
   - **3.2.** Turn the front turn signal light bulb socket (2) to the left to remove it.
   - **3.3.** Press the bulb (3) in and turn it to the left to remove it from the socket.



LNW780SH002401

Installation Procedure

Follow the removal procedure in the reverse order.

Front Turn Signal Lamp Replacement

Removal Procedure

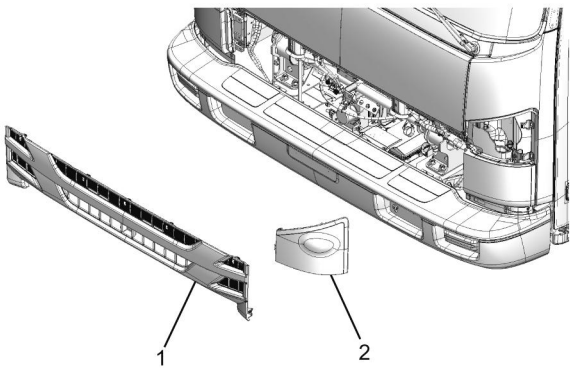
Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

1. Disconnect the battery ground cable.

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.

2. Remove the front grill (1).
   - 2.1. Remove the screw at the center or the front grill.
   - 2.2. Remove the seven clips securing the front grill.
3. Remove the front turn signal light (2).
   - 3.1. Remove the nut of turn signal light of front side.
   - 3.2. Open the front door and unfasten the two screws through the space between the door and the cab using a Philips screwdriver.
   - 3.3. Remove the front turn signal light harness connector.



LNWG9ASH000301

Installation Procedure

Follow the removal procedure in the reverse order.

Caution:

- Do not touch the glass portion of the new bulb with your fingers.
- If the bulb socket’s lock is insufficient, water may infiltrate the light’s interior and cause a malfunction.

Hazard Lamp and Turn Signal Lamp Flasher Replacement

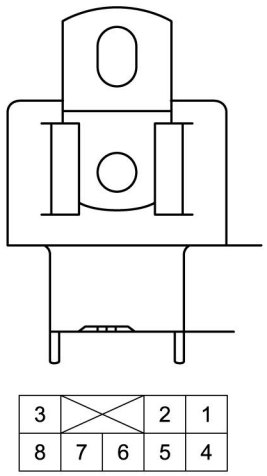
Inspection Procedure

Check the following circuits for an open circuit, short circuit (power supply and GND), and high resistance.

If any abnormality is found in the circuit, repair or replace the relevant circuit.

- Between the flasher unit terminal 1 and the cab J/B 1 terminal 4
- Between the flasher unit terminal 4 and the cab J/B 1 terminal 5
- Between the flasher unit terminal 3 and the front turn signal light (LH) terminal 1
- Between the flasher unit terminal 3 and the side turn signal light (LH) terminal 1
- Between the flasher unit terminal 3 and the rear combination light (LH) terminal 3
- Between the flasher unit terminal 2 and the front turn signal light (RH) terminal 1
- Between the flasher unit terminal 2 and the side turn signal light (RH) terminal 1
- Between the flasher unit terminal 2 and the rear combination light (RH) terminal 3
- Between the flasher unit terminal 8 and the hazard warning flasher switch terminal 3
- Between the flasher unit terminal 5 and the combination switch terminal 2
- Between the flasher unit terminal 6 and the combination switch terminal 3
- Between the flasher unit terminal 7 and the sub J/B 1 terminal 4

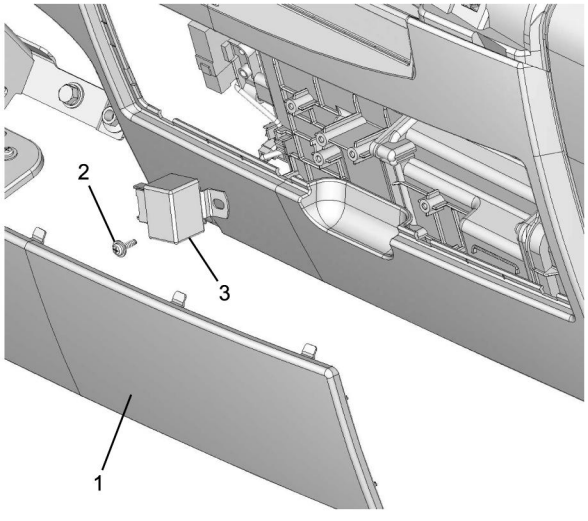
If the circuit and the switch are normal, replace the flasher unit.



LNW780SH010401

Removal Procedure

1. Remove the relay box lid (1).
2. Remove the fixing screw (2).
3. Remove the flasher unit (3).



LNW780SH005601

Installation Procedure

Follow the removal procedure in the reverse order.

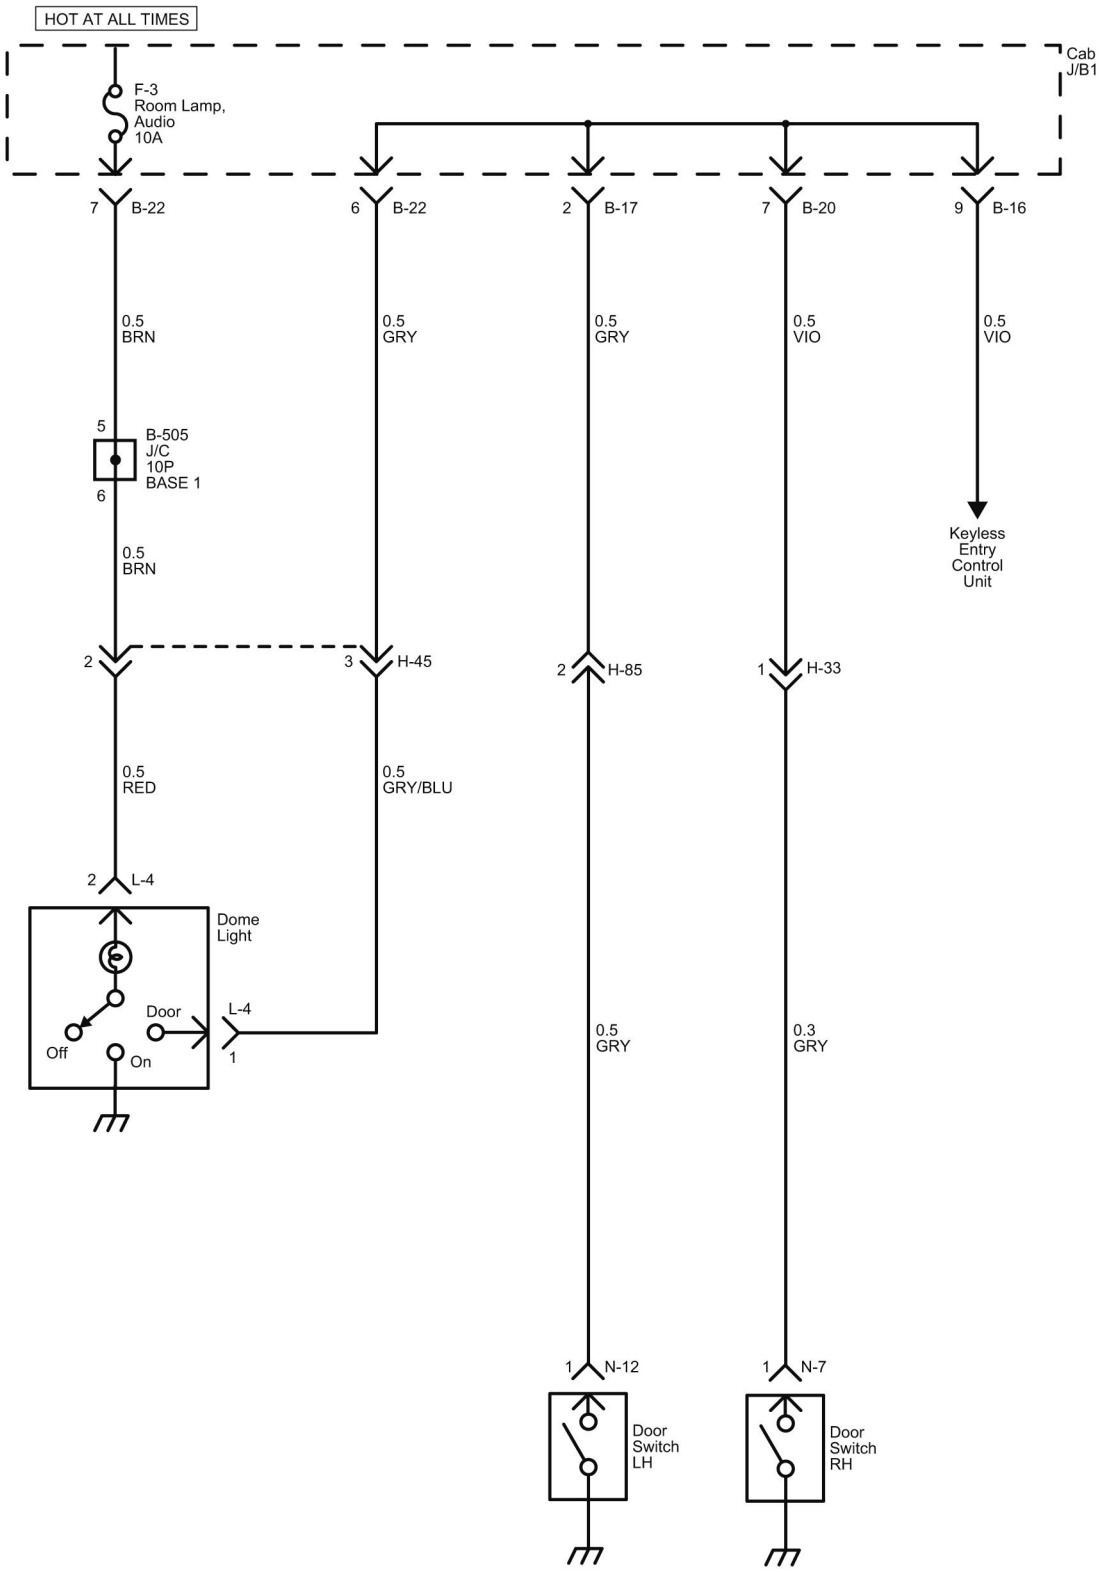
LNWD80LF000601



LNWH80XF001301

Description and Operation

Wiper/Washer System Circuit Description

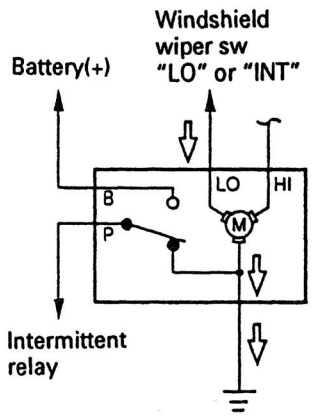
The circuit consists of the ignition switch, windshield wiper and washer switch, wiper motor, washer motor the intermittent relay horn switch and horn.

When the wiper and washer switch is turned on with starter switch on, the battery voltage is applied to the wiper motor to activate the wiper.

The washer motor squirts glass cleaning fluid while the washer switch is being pushed. The intermittent relay is used to control motion of the wiper.

Operation of Windshield Wiper Motor (When Wiper “LO” or “INT” Position)

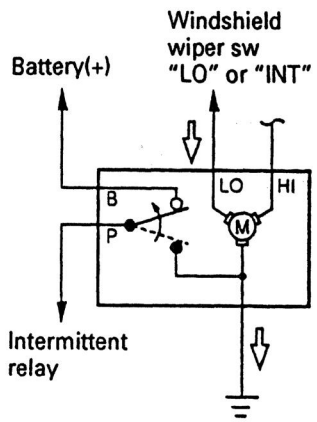
1. Condition of wiper switch is “LO” or “INT” position (Wiper motor is starting to operate)



NOTE: Arrow marks " ⇨ " indicate the direction of current.

LNW38ASH009301

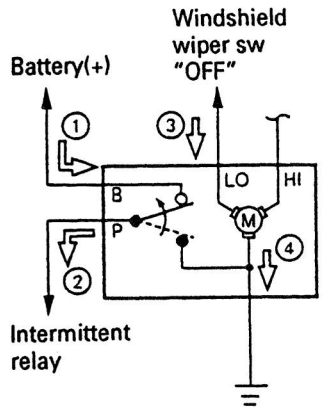
2. Condition of wiper motor is operating



NOTE: Arrow marks " ⇨ " indicate the direction of current.

LNW38ASH009401

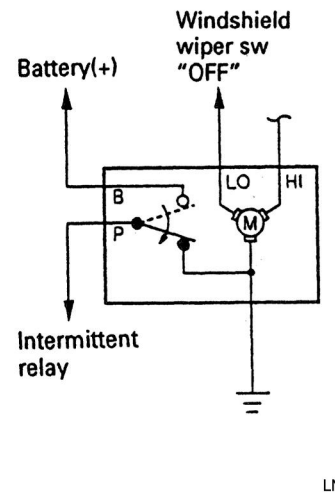
3. Condition of wiper switch is just "OFF" (Wiper motor is still operating until auto-stop position)



NOTE: Arrow marks " ⇨ " indicate the direction of current.

LNW38ASH009501

4. Wiper motor stops at auto-stop position



LNW38ASH009601

Diagnostic Information and Procedures

Horn System Diagnosis

Horn Does Not Sound

Visual and Physical Checks

Check and repair the following items:

- Battery voltage

  If a problem found, charge the battery or replace the battery.

- Fuses

  If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Ground terminals

  If an intermittent, a poor connection or corrosion is found, repair the connection or clean the terminal.

  - Electrical connections or wiring
  - Check for poor mating of the connector halves, or terminals not fully seated in the connector body, backed-out.
  - Check for improperly formed or damaged terminals. Carefully reform or replace all the connector terminals in the problem circuit to ensure the proper contact tension.
  - Check for poor terminal to wire connections. This requires removing the terminal from the connector body to check.

- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. (These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use.)

  If a problem found, remove accessories or correct the installation.

Components Check

Check and repair the following items:

- Fuse
  - F-25 Horn (15A)

    Refer to Fuse, Fusible Link, and Slow-Blow Fuse Description.

    If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Horn switch

  Refer to CELL Link Error - Link target cell (cell ID 281980) is invalid for this publication..

  If a problem found, replace the combination switch.

- Relay
  - X-7 Horn Relay

    Refer to CELL Link Error - Link target cell (cell ID 281982) is invalid for this publication..

    If a problem found, replace the relay.

- Horn

  Refer to CELL Link Error - Link target cell (cell ID 281977) is invalid for this publication...

  If an open or improper installation found, replace the bulb or correct the installation.

Circuit Check

Check the following circuits for an open, short to ground, short to battery or ignition voltage and high resistance. If a problem found, repair or replace as necessary.

- Between the Horn fuse (F-25) and the Horn relay.
- Between the Horn relay and the horn switch.
- Between the Horn relay and the horns.

Horn Does Not Shut Off

Visual and Physical Checks

Check and repair the following items:

- Battery voltage

  If a problem found, charge the battery or replace the battery.

- Fuses

  If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Ground terminals

If an intermittent, a poor connection or corrosion is found, repair the connection or clean the terminal.

- Electrical connections or wiring
  - Check for poor mating of the connector halves, or terminals not fully seated in the connector body, backed-out.
  - Check for improperly formed or damaged terminals. Carefully reform or replace all the connector terminals in the problem circuit to ensure the proper contact tension.
  - Check for poor terminal to wire connections. This requires removing the terminal from the connector body to check.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. (These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use.)

  If a problem found, remove accessories or correct the installation.

Components Check

Check and repair the following items:

- Horn switch

  Refer to CELL Link Error - Link target cell (cell ID 281980) is invalid for this publication..

  If a problem found, replace the combination switch.
- Relay
  - X-7 Horn Relay

    Refer to CELL Link Error - Link target cell (cell ID 281982) is invalid for this publication..

    If a problem found, replace the relay.

Circuit Check

Check the following circuits for an open, short to ground, short to battery or ignition voltage and high resistance. If a problem found, repair or replace as necessary.

- Between the Horn relay and the horn switch.
- Between the Horn relay and the horns.

Description and Operation

Radio and Cigarette Lighter Circuit Description

The circuit consists of the ignition switch, audio, cigarette lighter and the relay.

The audio circuit is designed for the current to flow through the receiver circuit when the audio switch is turned on with the ignition switch in “ACC” or “ON”. Current runs through the memory circuit of the audio regardless of the position of the ignition switch.

When the cigarette lighter is pushed in with the ignition switch at either “ACC” or “ON” position, a circuit is formed in the cigarette lighter case to heat the lighter coil. The cigarette lighter is spring back to its original position after the lighter coil is heated.

Description and Operation

Instrument Cluster Description and Operation

Description of Function and Operation

The following gauges and various warnings / indicators (warning lamp and indicator lamp) are assembled to the instrument panel (IP) cluster.

- Speedometer
- Tachometer (engine rpm gauge)
- Fuel gauge
- Engine coolant temperature gauge
- Odometer/ Trip meter
- Shift indicator
- Multi-information display

These components cannot be replaced separately because they are integrated with the IP cluster.

In addition, they are communicating with the engine control module (ECM), the transmission control module (TCM), the MIMAMORI control unit and the electronic hydraulic control unit (EHCU) etc. via ECU and CAN.

Speedometer

Speedometer indicates the vehicle speed based on the vehicle speed signal outputted from the engine control module (ECM). The vehicle speed signal is corrected at ECM and inputted into the IP cluster through CAN communication.

Tachometer

Tachometer indicates the engine revolutions based on the engine revolution signal from ECM. The engine speed signal is a signal from the crankshaft position (CKP) sensor detected by ECM and inputted into the IP cluster through CAN communication.

Fuel Gauge

Fuel gauge indicates the remaining fuel level based on the signal of the fuel tank unit of the fuel tank. Fuel gauge indicates the remaining fuel level as "low" when the resistance of the fuel level detector of the fuel tank unit is high. The fuel gauge indicates the remaining fuel level as "high" when the resistance of the fuel level detector is low.

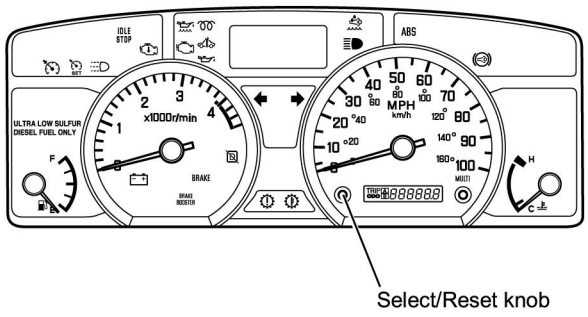
Engine Coolant Temperature Gauge

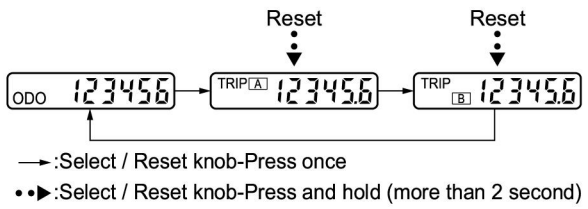
Engine coolant temperature gauge indicates the engine coolant temperature based on the engine coolant temperature signal from the ECM. The engine coolant temperature signal is a signal from the engine coolant temperature (ECT) sensor, which is detected by ECM and inputted into the thermometer through CAN communication.

Odometer/Trip Meter

Odometer/ trip meter calculate and display the mileage based on the vehicle speed signal from the ECM or from the vehicle speed sensor. Odometer/ trip meter will be displayed for 5 minutes after the ignition switch is turned "OFF".

Switch the display using the Select/ Reset knob operation.





LNWD80MH000201

Switching indication

- ODO > TRIP A > TRIP B > ODO

Hour Meter

The hour meter uses multi-information display to show accumulated engine operating time. The engine operating time is calculated by MIMAMORI control unit interlocked with the engine operation and inputted into the IP cluster through CAN communication. When the engine operation time data has not been obtained through CAN communication for 2 seconds or more, "ERROR" is displayed on the multi-information display.

Refer to "MIMAMORI control" in Section 8K Vehicle Control for resetting counters.

Multi-information Display

The display functions to display information, warning lamp, indicator lamp and maintenance information.

Information Display

- Total fuel consumption, Sectional fuel consumption, and Instantaneous fuel consumption.

  If the speedometer is graduated in both mile and kilometer, the fuel economy is indicated in miles per gallon (MPG).

  - Fuel consumption display is requested to the MIMAMORI and the data obtained through CAN communication will be displayed. When the fuel consumption indication data has not been obtained through CAN communication for 2 seconds or more, "ERROR" is displayed on the multi-information display.
  - "99.9MPG" is displayed when the total or the sectional fuel consumption data is 99.9MPG or more.
  - The total fuel consumption display is reset at the MIMAMORI. Refer to the "MIMAMORI System" in Section 8K Vehicle Control.
  - The sectional fuel consumption is reset when you reset the trip B.
  - The instantaneous fuel consumption is the fuel consumption at a certain moment while driving the vehicle.

- DPF display
  - When DPF display is selected, the DPF regeneration status signal is obtained through CAN communication from ECM. PM accumulation volume is displayed when there is no regeneration, and the DPF regeneration progress will be displayed when DPF is under regeneration.
  - PM accumulation volume is displayed in 6 levels. The display on the multi-information display increases as the accumulation volume increases.
  - DPF regeneration progress is displayed in 6 levels. The display on the multi-information display decreases as the regeneration progresses.

- Selective catalyst reduction (SCR) system display
  - The selective catalyst reduction (SCR) displays in a scale of 4 levels.

- Voltage meter
  - The voltage meter displays the battery voltage in a scale of 9 levels.

- Calendar and Clock

- Dimmer
  - The brightness of MID can be adjusted while the light control switch is OFF.

Warning Lamp and Indicator Lamp Display

- Air cleaner indicator lamp
- Exhaust system warning lamp
- Regeneration required warning lamp
- Selectable (switch) regeneration required warning lamp
- Regeneration in progress indicator lamp
- Checking PM level indicator lamp
- Low fuel warning lamp
- Water separator (fuel filter) warning lamp
- Engine overheat warning lamp
- Restart time(s) warning lamp
- No restart warning lamp
- Meter failure
- CAN system error
- Refill diesel exhaust fluid (DEF) warning lamp
- SCR system malfunction warning
- Incorrect diesel exhaust fluid (DEF) warning lamp

Maintenance Indications

- Engine oil and Filter indicator lamp
- Transmission and differential gear oil indicator lamp
- Starter indicator lamp
- Fuel filter indicator lamp
- Power steering fluid indicator lamp
- Tire rotation indicator lamp

The maintenance display displays the maintenance schedule for each item. Pre-set distances of each maintenance item are counted down and maintenance recommended periods are indicated by color changes from (Green) to (Amber) and warnings are displayed when turning the ignition switch to "ON". (The maintenance display is displayed when the vehicle speed is 16MPH (25km/h) or less.)

Diagnostic Information and Procedures

Engine Coolant Temperature Indicator Diagnosis

Engine Coolant Temperature Gauge Needle Does Not Move

Visual and Physical Checks

Check and repair the following items:

- Battery voltage

  If a problem found, charge the battery or replace the battery.

- Fuses

  If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Ground terminals

  If an intermittent, a poor connection or corrosion is found, repair the connection or clean the terminal.

- Electrical connections or wiring
  - Check for poor mating of the connector halves, or terminals not fully seated in the connector body, backed-out.
  - Check for improperly formed or damaged terminals. Carefully reform or replace all the connector terminals in the problem circuit to ensure the proper contact tension.
  - Check for poor terminal to wire connections. This requires removing the terminal from the connector body to check.

- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. (These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use.)

  If a problem found, remove accessories or correct the installation.

Components Check

Check and repair the following items:

- Engine coolant temperature (ECT) sensor

  Check the diagnostic trouble code (DTC) related to ECT sensor in the engine control system. Refer to Engine Control System.

  If the DTC is set, go to applicable DTC chart.

- Controller area network (CAN) communication.

  Check the diagnostic trouble code (DTC) related to CAN communication in the engine control system or transmission control system. Refer to Engine Control System.

- ECT gauge

  If a problem at the other parts and circuits not found, replace the instrument panel (IP) cluster.

Engine Coolant Temperature Gauge Reading is Too Low (or High)

Visual and Physical Checks

Check and repair the following items:

- Battery voltage

  If a problem found, charge the battery or replace the battery.

- Fuses

  If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Ground terminals

  If an intermittent, a poor connection or corrosion is found, repair the connection or clean the terminal.

- Electrical connections or wiring
  - Check for poor mating of the connector halves, or terminals not fully seated in the connector body, backed-out.
  - Check for improperly formed or damaged terminals. Carefully reform or replace all the connector terminals in the problem circuit to ensure the proper contact tension.
  - Check for poor terminal to wire connections. This requires removing the terminal from the connector body to check.

- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. (These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use.)

  If a problem found, remove accessories or correct the installation.

Components Check

Check and repair the following items:

- Engine coolant temperature (ECT) sensor

  Check the diagnostic trouble code (DTC) related to ECT sensor in the engine control system. Refer to Engine Control System.

If the DTC is set, go to applicable DTC chart.

- Controller area network (CAN) communication.

  Check the diagnostic trouble code (DTC) related to CAN communication in the engine control system or transmission control system. Refer to Engine Control System.

- Thermostat

  Refer to CELL Link Error - Link target cell (cell ID 281299) is invalid for this publication..

  If a problem found, replace the thermostat.

- ECT gauge

  If a problem at the other parts and circuits not found, replace the instrument panel (IP) cluster.

Needle Overshoots (or Goes Up to the "H" Range)

Visual and Physical Checks

Check and repair the following items:

- Battery voltage

  If a problem found, charge the battery or replace the battery.

- Fuses

  If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the fuse or replace the shorted attached component.

- Ground terminals

  If an intermittent, a poor connection or corrosion is found, repair the connection or clean the terminal.

- Electrical connections or wiring
  - Check for poor mating of the connector halves, or terminals not fully seated in the connector body, backed-out.
  - Check for improperly formed or damaged terminals. Carefully reform or replace all the connector terminals in the problem circuit to ensure the proper contact tension.
  - Check for poor terminal to wire connections. This requires removing the terminal from the connector body to check.

- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. (These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use.)

  If a problem found, remove accessories or correct the installation.

Components Check

Check and repair the following items:

- Engine coolant temperature (ECT) sensor

  Check the diagnostic trouble code (DTC) related to ECT sensor in the engine control system. Refer to Engine Control System..

  If the DTC is set, go to applicable DTC chart.

- Controller area network (CAN) communication.

  Check the diagnostic trouble code (DTC) related to CAN communication in the engine control system or transmission control system .Refer to Engine Control System.

- ECT gauge

  If a problem at the other parts and circuits not found, replace the instrument panel (IP) cluster.

Repair Instructions

Instrument Cluster Replacement

Removal Procedure

Warning: **Refer to CELL Link Error - Link target cell (cell ID 178001) is invalid for this publication..**

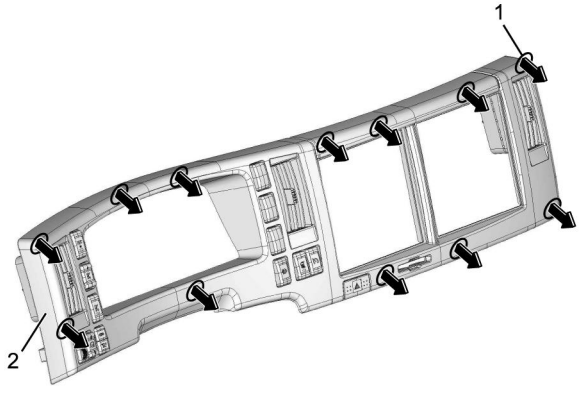
1. Disconnect the battery ground cable

   Note:

   - Do not disconnect within 3 minute after turning OFF the ignition switch.
   - The ECM may malfunction if the battery cable is disconnected within 3 minutes.

2. Remove the instrument panel (IP) cluster.

   Refer to CELL Link Error - Link target cell (cell ID 282089) is invalid for this publication..

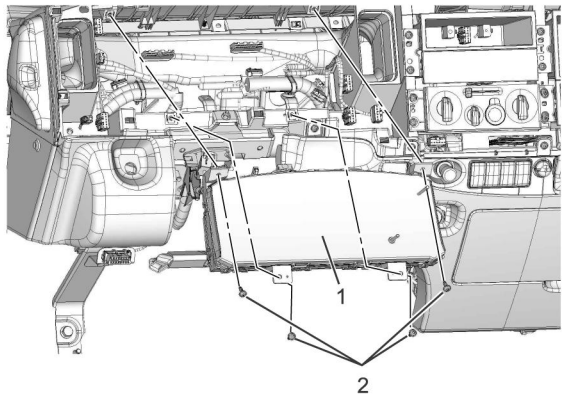


LNW78DSH002901

3. Remove the instrument panel (IP) cluster (1).

   3.1. Remove the four screws (2)

   3.2. Disconnect the instrument panel (IP) cluster connector.



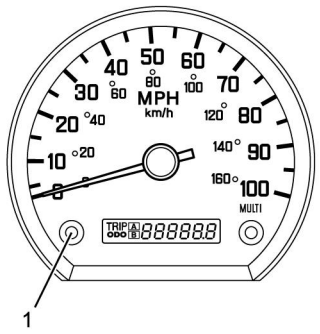
LNW78DSH003001

Installation Procedure

To install, follow the removal steps in the reverse order.

Diagnostic Information and Procedures

Speedometer Test



LNWA80SH000401

The speedometer is made up of the stepper motor type ammeter (movement) that displays indications, the stepper motor that drives and adds up the odometer and trip meter, and the driving circuit (printed circuit board) that makes exchanges between the pulse signals and the current.

Odometer alternates with trip meter by pushing select/reset knob.

On-Vehicle Service

Check the instrument panel (IP) cluster display accuracy and the operation of the odometer with the speedometer tester.

Tester Display Speed	Instrument Panel Cluster Display Permissible Level
40 MPH 60 km/h	39.2 – 40.8 MPH 58.5 – 61.5 km/h
60 MPH 100 km/h	59.0 – 61.0 MPH 98.5 – 101.5 km/h

Note: Inappropriate tire inflation may affect the accuracy of the odometer.

(To conduct this test, refer to the tester manufacture instruction manual.)

Since the instrument panel (IP) cluster display permissible levels above are specifications solely for the instrument panel (IP) cluster, they are to be used as reference values when conducting on-vehicle service.

Description and Operation

Keyless Entry System Circuit Description

The circuit consists of the keyless entry control unit, remote controller key, key remaind switch, door lock relay, door lock motor, door switch, and etc..

The signal that the keyless entry control unit receives is sent to the door lock relay when the remote controller key button is pressed. The door lock relay operates the door lock motor and the doors will be locked or unlocked.

The Keyless Entry System is equipped with the following functions.

- Lock and unlock functions by remote controller operation, auto re-lock function and retry function.
- Remote controller key registration function
- Answer-back function

For lock and unlock functions with the remote controller operation, when locking/unlocking, the driver side door and passenger side door are controlled at the same time. For double cab models, the rear doors are also controlled at the same time.

The auto re-lock function locks the door automatically if the door is not open for 30 seconds or more after unlocking.

The remote controller operation is disabled if the following are met.

- Battery power supply is not applied to the keyless entry control unit.
- The key is inserted into the key cylinder.
- The door is open.
- The ignition switch position is ON or ACC.

If the driver side door is not locked when the doors are locked by the remote controller operation, the retry function locks automatiocally one second later (only once).

When any of the following are met, until the retry function activates, the retry function is disabled.

- The door is open.
- The remote controller key is inserted to the key cylinder.
- An operation is newly performed by the remote controller key.

For the remote controller key registration function, the remote controller operation registration is accepted only from the genuine remote controller key. It is possible to register a maximum of 4 remote controller keys.

If 4 remote controller keys are registered, the oldest code is cleared for additional registrations. For the registration procedure of the remote controller key, refer to Registration of the remote controller key.

For the answer-back function, perform the answer-back using the hazard lights. There are the following 2 patterns for the answer-back. Answer-back will not activate when auto re-lock is performed.

- 1 flash: when locked by the remote controller key or locked by the auto re-lock function.
- 2 flashes: when unlocked by the remote controller key

Description and Operation

HVAC Circuit Description

The air conditioning circuit consists of compressor, A/C switch, fan switch, etc. When the engine is rotating, the A/C starts to work with both the A/C and fan switches “ON”, followed by the engagement of the magnetic clutch. It stops to work when either the fan switch or the A/C switch turns “OFF”. In addition, the A/C has the function of temporary stop of its operation by function of the pressure switch when sensing abnormal rise of the refrigerant pressure.

Description and Operation

Power Windows

The circuit consist of the ignition switch, power window switch for each of the windows and power window motor.

When the ignition switch is turned on, the battery voltage is applied to each of the power window switches through the circuit breaker and the power window relay on the circuit.

By operating the switches of each window to select “UP” or “DOWN”, the revolving direction of the power window motor changes to open or close the window.

The driver’s power window switch has a built-in one-touch operating circuit which allows to automatically open the window by operating the switch to the AUTO position.

Operation of Passenger Side Window

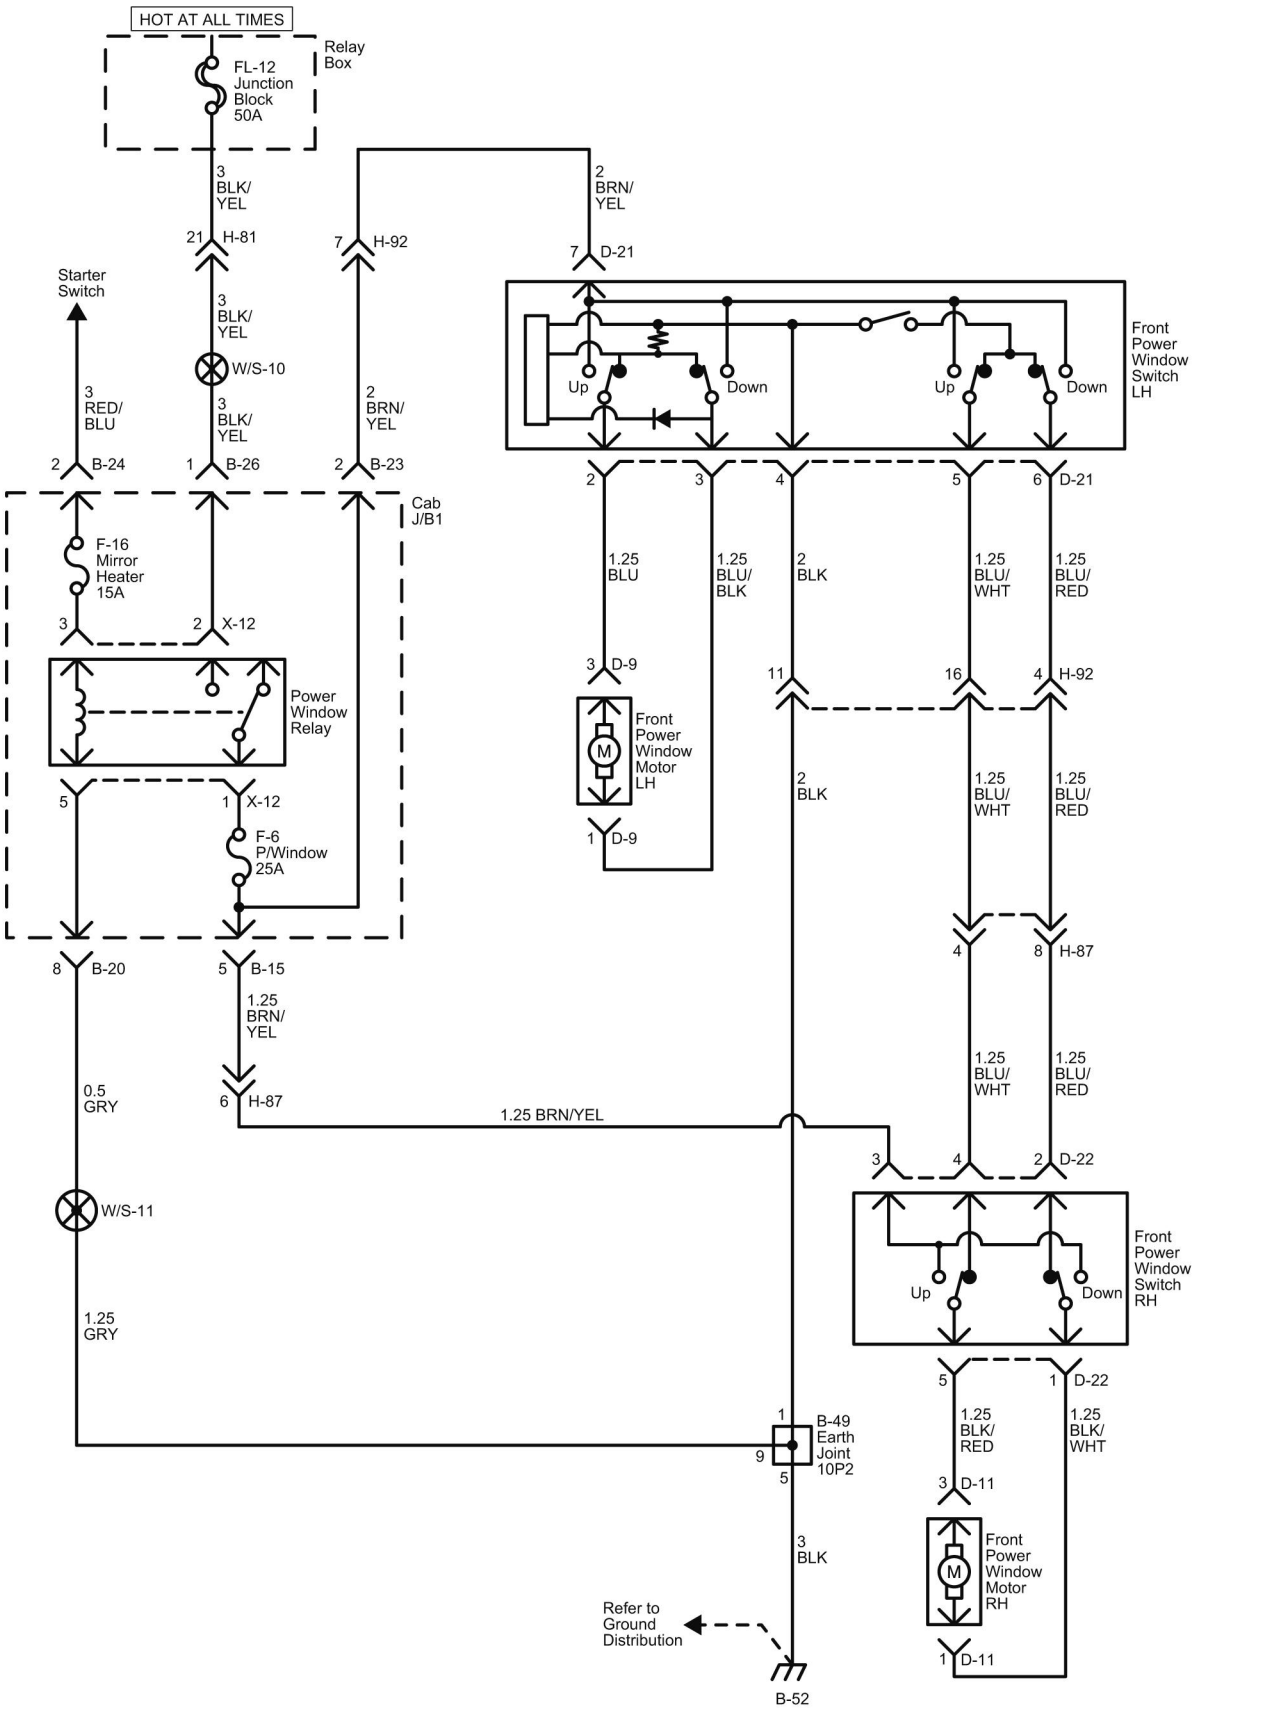
Power Window Schematics



Description and Operation

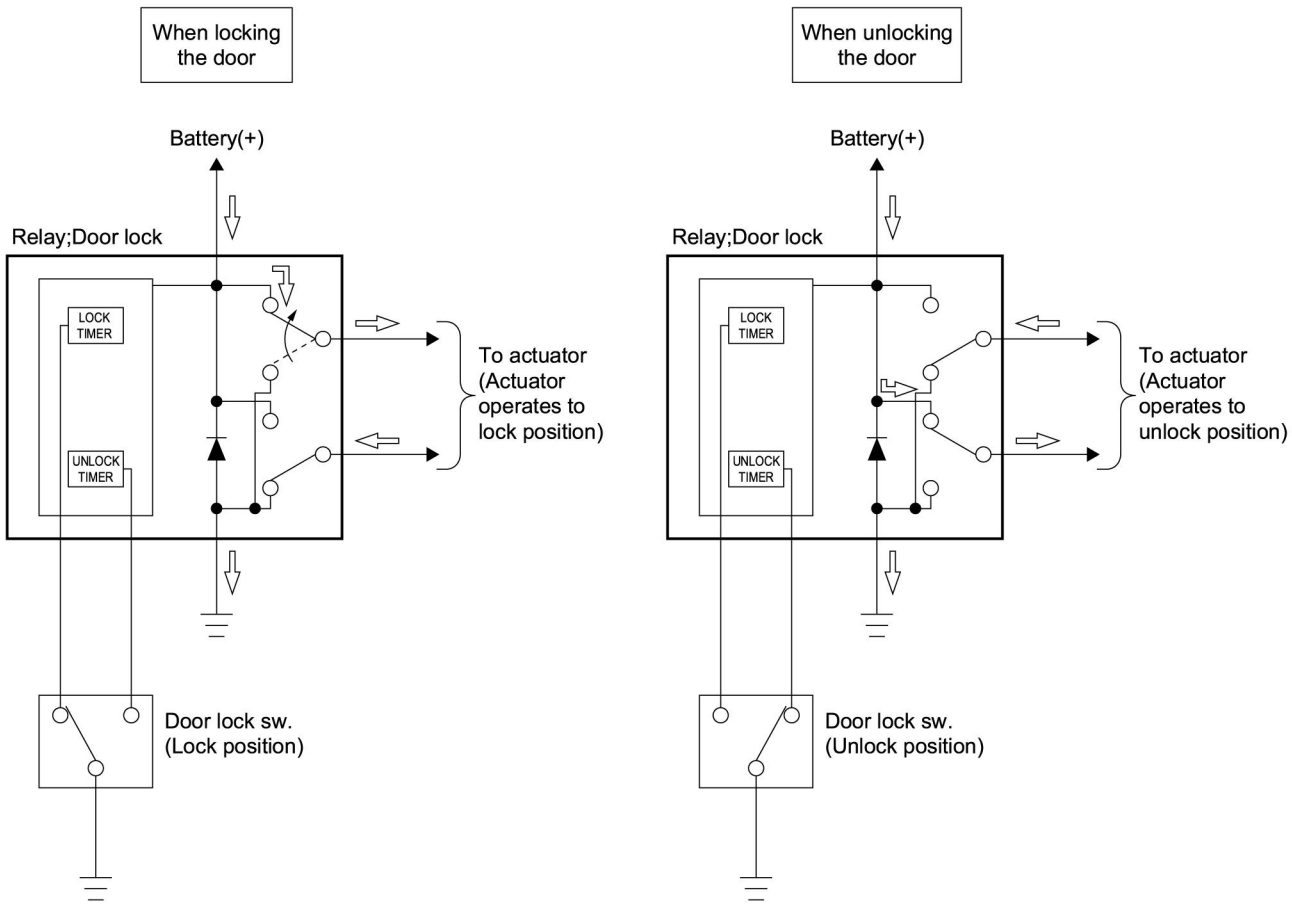
Power Door Locks Circuit Description

The circuit consists of the door lock switch, actuator for the front passenger side door, and the door lock controller.

The door lock relay is always provided with battery voltage. The key or the inside lock knob on the drivers side door can activate the lock mechanism of all the doors.

When the drivers side door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the relay to activates the actuator to lock and unlock the doors.

OPERATION OF DOOR LOCK CONTROLLER



NOTE: Arrow marks " ⇨ " indicate the direction of current

Description and Operation

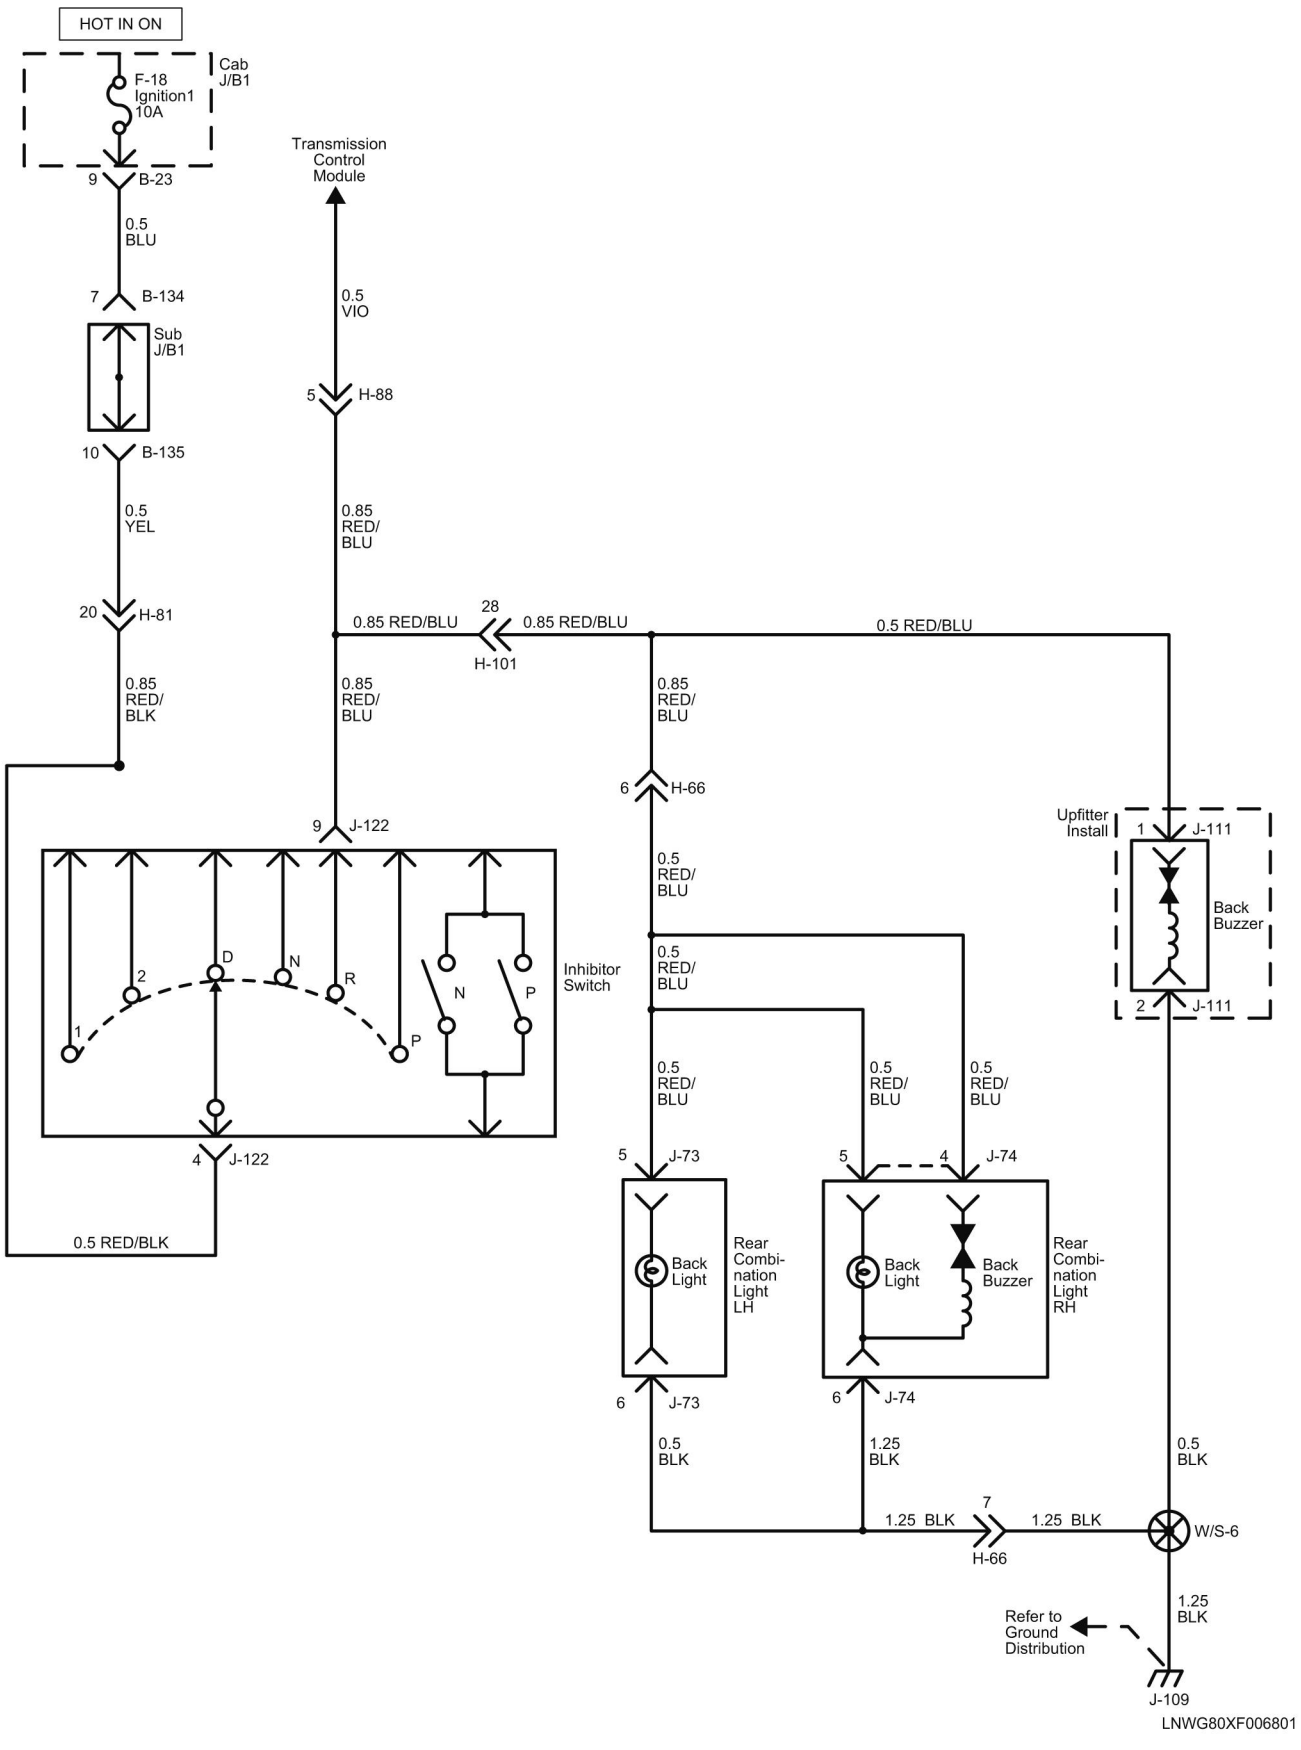
Backup Alarm System Circuit Description

The circuit consists of the backup light switch (or the inhibitor switch) and back buzzer.

When the reverse position is selected, the backup light switch (or the inhibitor switch) is turned ON and the back buzzer sound.

Schematic and Routing Diagrams

Backup Alarm System Schematics



Description and Operation

Battery Description

The battery has three main functions. It provides a source of energy for cranking the engine, acts as a voltage stabilizer for the electrical system and, for a limited time, can provide energy when the electrical load exceeds the output of the generator.

Refer to “Specifications” at the end of this section for specific application.

Water never needs to be added to the sealed battery so there are no filler caps on the cover. The special chemical composition inside the battery reduces gassing to a very small amount at normal charging voltages. There are small vent holes in the cover to allow what little gas is produced inside the battery to escape. The special chemistry is also designed to greatly reduce the possibility of overcharge damage.

Since there are vent holes in the cover, the battery should always be kept in an upright position. A small amount of electrolyte may leak from the top of the battery if it is tipped at an angle of more than 45 degrees.

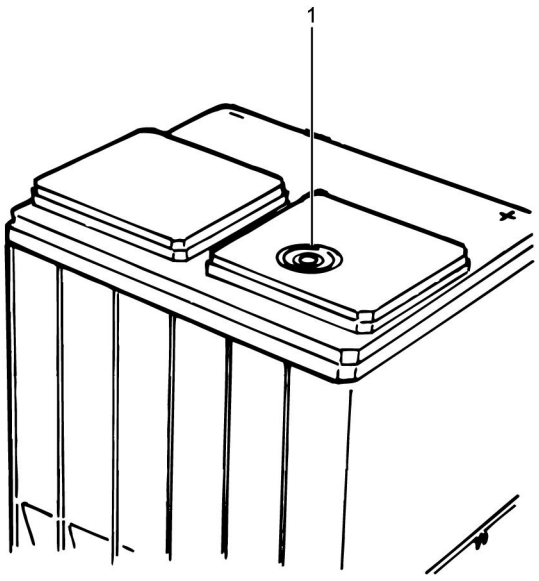
Do not tip the battery more than 45 degrees when carrying or installing it.

Evidence of electrolyte leakage does not necessarily mean that the battery is defective.

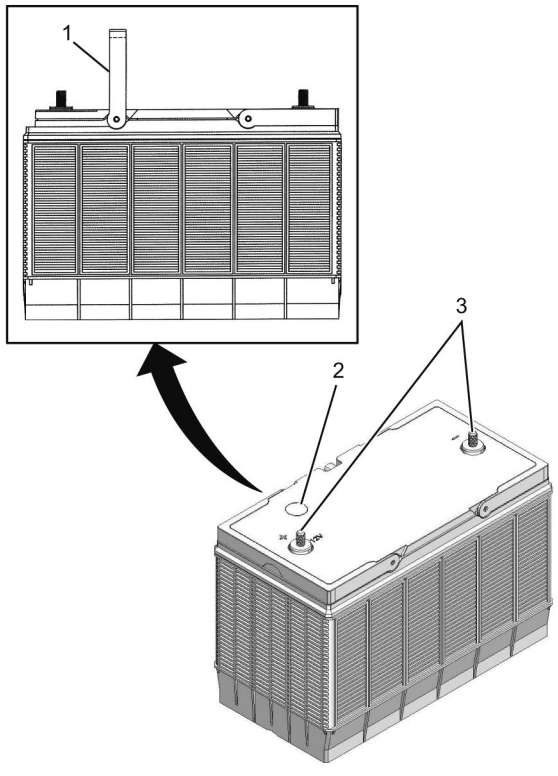
Ratings

A battery generally has two classifications of ratings:

1. A reserve capacity rating at 27°C (80°F).
2. A cold rating at -18°C (0°F), which indicates the cranking load capacity.



LNW46DMH000101

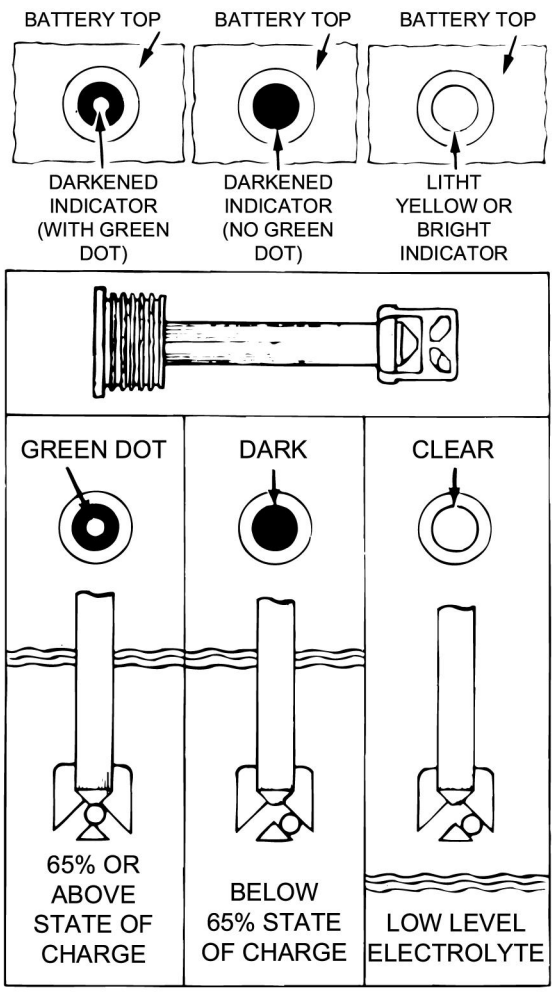


LNWD80MH000401

Built-in Hydrometer

The sealed battery has a special temperature compensated hydrometer built into the cover to show the battery’s state of charge.

The hydrometer has a green ball within a cage that is attached to a clear plastic rod. The green ball floats at a predetermined specific gravity of the electrolyte representing about a 65 percent state of charge. When the green ball floats, it rises within the cage and positions itself under the rod. A green dot then can be seen in the center of the hydrometer. The built-in hydrometer provides a guide for battery testing and charging. In testing, a visible green dot means the battery is charged enough for testing. If the green dot is not visible, it means the battery must be charged before the test procedure is performed.



LNW46DLH000101

In charging, the appearance of the green dot means that the battery is sufficiently charged. Charging can then be stopped to prevent overcharging.

The hydrometer on some batteries may be clear or light yellow. This means the fluid level is below the bottom of the rod and attached cage.

This may have been caused by excessive or prolonged charging, a broken case, excessive tipping or normal battery wear out. If a cranking complaint exists, and the hydrometer is clear or light yellow, replace the battery – do not charge, test or jump start the battery.

In order to properly observe the hydrometer, the top of the battery should be clean. A light may also be required when working in a poorly lit area.

Common Causes of Failure

If tests show that a battery is good, yet it does not perform well in service, one of the following conditions may be the problem:

1. Vehicle accessories left on for an extended period of time.
2. Problem in the charging system, such as a slipping fan belt, high wiring resistance, or a faulty generator or regulator.
3. A vehicle electrical load exceeding the generator capacity, with the addition of electrical devices such as radio equipment, air conditioning, window defoggers, or light systems.
4. Problems in the electrical system, such as shorted or pinched wires.
5. Extended slow-speed driving with many accessories turned on.
6. Loose or poor battery cable-to-post connections, previous improper charging or run-down battery, or loose hold-downs.
7. High-resistance connections or other problems in the cranking system.

Electrolyte Freezing

The freezing point of electrolyte depends on its specific gravity. Since freezing may ruin a battery, it should be protected against freezing by keeping it in a charged condition.

Carrier and Hold-Down

The battery carrier and hold-down should be clean and free from corrosion before installation.

The carrier should be in a sound mechanical condition so that it will support the battery securely and keep it level. Be certain there are no foreign objects in the carrier before installation.

To prevent the battery from shaking in its carrier, the hold-down bolts should be tight. However, the bolts should not be tightened to the point where the battery case or cover will be placed under a severe strain.

Controller Area Network (CAN) Circuit Description

The circuit consists of the engine control module (ECM), the transmission control module (TCM), the glow plug control module (GPCM), and the instrument panel (IP) cluster. These ECU always communicate each other through the CAN circuit.

The ECM and the TCM have another CAN circuit for communicate with a scan tool. The circuit consists of the ECM, the TCM and the data link connector (DLC).

Data Link Connector Circuit Description

The Data Link Connector (DLC) is the connector for communications and connections with external diagnostic devices (scan tools) and controllers. The Diagnostic Trouble Code (DTC) stored in the ECM, TCM, Mimamori, DEF and EHCU memory can be read either through a hand-held diagnostic scanner such as external diagnostic devices plugged into the DLC or by counting the number of flashes of the light when the diagnostic test terminal of the DLC is grounded.

Engine Control Module Description

The ECM is located on the chassis frame of the engine left side via mounting bracket. The ECM controls the following:

- The fuel supply control
- The fuel injection timing control
- The exhaust gas recirculation (EGR) control
- The on-board diagnostics for engine control
- The cruise control
- The exhaust brake control

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational problems, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

Refer to the Engine Control System.

Fuse, Fusible Link, and Slow-Blow Fuse Description

Fuse

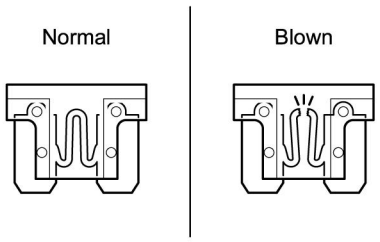
Fuses are the most common form of circuit protection used in vehicle wiring. A fuse is a thin piece of wire or strip of metal encases in a glass or plastic housing. It is wired in series with the circuit it protects. When there is an overload of current in a circuit, such as a short of a ground, the wire or metal strip is designed to burn out and interrupt the flow of current. This prevents a surge of high current from reaching and damaging other components in the circuit.

Determine the cause of the overloaded before replacing the fuse.

The replacement fuse must have the same amperage specifications as the original fuse.

Never replace a blown fuse with a fuse of a different amperage specification.

Doing so can result in an electrical fire or other serious circuit damage. A blown fuse is easily identified.



LNW780SH011301

Fusible Link

The fusible link is primarily used to protect circuits where high amounts of current flow and where it would not be practical to use a fuse. For example, the starter circuit. When a current overload occurs, the fusible link melts open and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.

Determine the cause of the overload before replacing the fusible link. The replacement fusible link must have the same amperage specification as the original fusible link.

Never replace a blown fusible link with fusible link of a different amperage specification. Doing so can result in an electrical fire or other serious circuit damage.

A blown fusible link is easily identified.

LNW48ASH004001

Slow-Blow Fuse

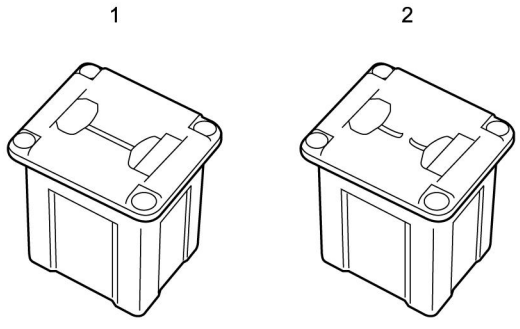
A slow-blow fuse is used in a circuit having a very high current flow (starter) or in an area where an ordinary fuse would be impractical.

Excessive current flow causes the fusible link inside the fuse to melt. Current flow is interrupted. Circuit damage caused by fire or heat is prevented.

Before replacing a fuse, determine the cause of the excessive current.

Always replace the burnt-out fuse with a new fuse of the same amperage rating. Replacing the fuse with one having a higher rating can result in a serious and expensive electrical fire.

Figure 1 shows a normal slow-blow fuse. Figure 2 shows a burnt-out fuse. it is easy to distinguish between the 2 fuses.



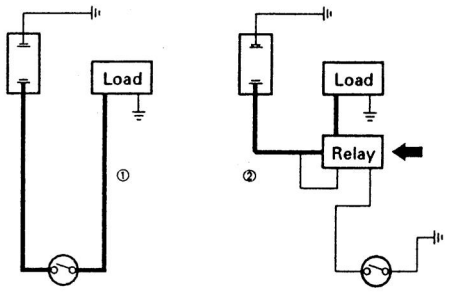
LNW780SH012101

Slow Blow Fuse Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30A	Pink	15
Connector	40A	Green	20
Connector	50A	Red	25
Connector	60A	Yellow	30

Relay Description

Battery and load location may require that a switch be placed some distance from either component. This means a longer wire and a higher voltage drop (1). The installation the battery and the load reduces the voltage drop (2). Because the switch controls the relay, amperage through the switch can be reduced.



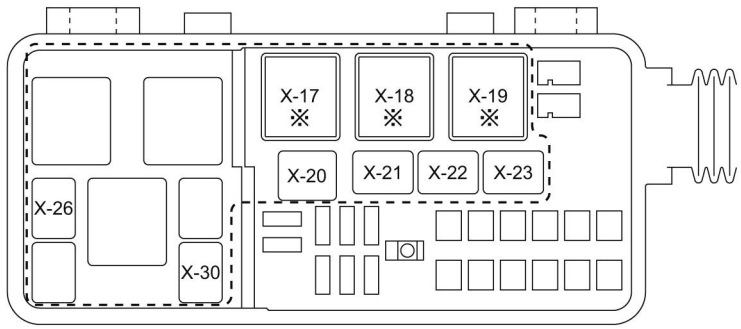
LNW38ASH002701

Relay Specification and Configuration

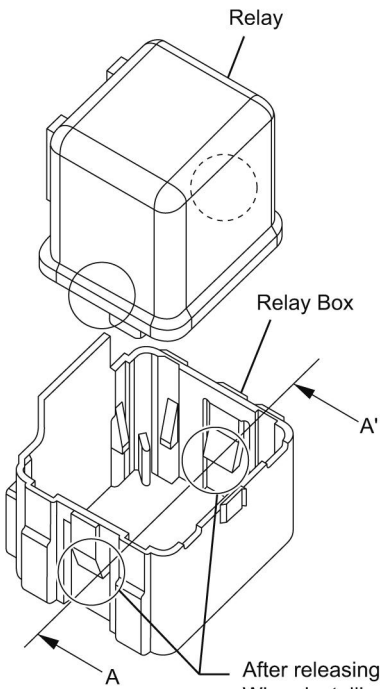
Name/Color	Rated Voltage/Coil Resistance	Internal Circuit
ACB 12201/Orange	12V/ Approx. 103Ω Minimum operating voltage: 7V at 20°C (68°F)	 LNW780SH011401
MR82C/ White Label	12V/ Approx. 23Ω Minimum operating voltage: 7V at 25°C (77°F)	 LNW780SH011501

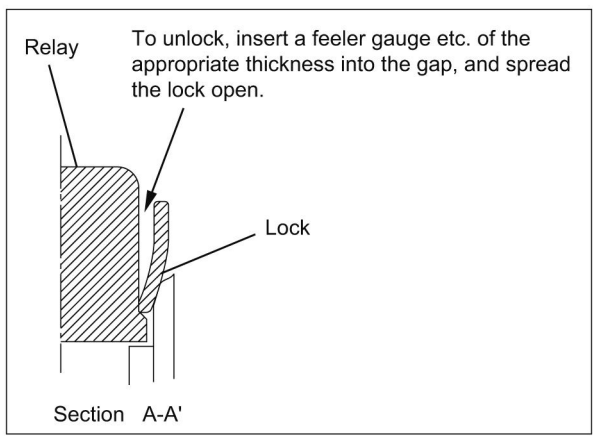
ACM12221 Black	12V/ Approx. 120Ω Minimum operating voltage: 7V at 25°C (77°F)	 RTW78ASH002701

Relay Exchange Method



When detaching the ※ marked relays, carry out work in accordance with the below procedures.



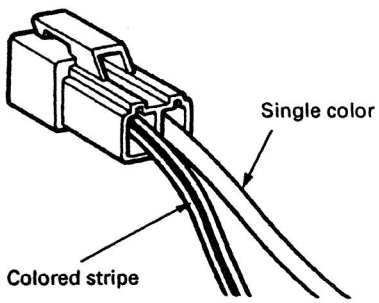


After releasing the locks in the 2 places marked with circles, remove the relay.
When installing, insert until a clicking noise is heard from the lock.

LNWG80LF000401

Wiring Description

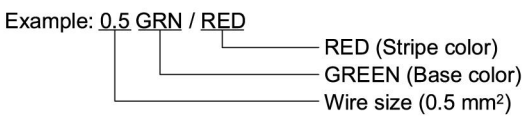
Wire Color



LNW38ASH002201

All wires have color-coded insulation.

Wires belonging to a system’s main harness will have a single color. Wires belonging to a system’s sub-circuits will have a colored stripe. Striped wires use the following code to show wire size and colors.



HCW480SH000101

Abbreviations are used to indicate wire color within a circuit diagram.

Refer to the following table.

Wire Color Coding

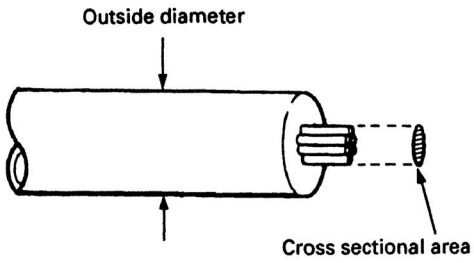
Color-Coding	Meaning	Color-Coding	Meaning
BLK	Black	BRN	Brown
WHT	White	LT GRN	Light Green
RED	Red	GRY	Gray
GRN	Green	PNK	Pink
YEL	Yellow	LT BLU	Light Blue
BLU	Blue	VIO	Violet
ORN	Orange	BEI	Beige

Distinction of Circuit by Wire Base Color

Base Color	Circuits	Base Color	Circuits
BLK	Starter circuit	YEL	Instrument Circuit
WHT	Charging circuit	BLU, ORN, BRN, LT GRN, GRY, PNK, LT BLU, VIO, BEI	Other Circuit
RED	Lighting circuit		
GRN	Signal circuits		

Wire Size

The size of wire used in a circuit is determined by the amount of current (amperage), the length of the circuit, and the voltage drop allowed. The following wire size and load capacity, shown below, are specified by AWG (American Wire Gauge) (Nominal size means approximate cross sectional area).



LNW38ASH002301

Wire Size Table

Nominal Size	Cross Sectional Area (mm^2)	Outside Diameter (mm)	Allowable Current (A)	AWG Size (Cross Reference)
0.3	0.372	1.8	9	22
0.5	0.563	2.0	12	20
0.85	0.885	2.2	16	18
1.25	1.287	2.5	21	16
2	2.091	2.9	28	14
3	3.296	3.6	37.5	12
5	5.227	4.4	53	10
8	7.952	5.5	67	8
15	13.36	7.0	75	6
