Attention Body Builders! Chevrolet LCF Medium Duty Body Body Builder guides are now available for FREE!- go to: www.gmupfitter.com

Download the Body Builder Guide or sections for important information about up fitting your Chevrolet LCF Medium Duty Commercial truck. All printed material, specifications, and drawings contained in the Chevrolet LCF Medium Duty Body Builder Guide are based on the latest information available at the time of publication/posting. The manufacturer reserves the right to discontinue or change, at any time, without notice specifications, options, materials, equipment, design and models.

Information contained in the guide includes:

- FMVSS safety standard
- EPA requirements
- OE recommendations
- Cautions for successful application up fitting and Frame modification procedures

PAGE

0.1

This guide has been provided as an aid to final stage manufacturers in determining conformity to the applicable Emission Control and Federal Motor Vehicle Safety Standards. Final stage manufacturers should maintain current knowledge of all Emission Regulations and Federal Motor Vehicle Safety Standards and be aware of their specific responsibility in regards to each standard.

Any manufacturer making material alterations to this incomplete vehicle during the process of manufacturing the complete vehicle should be constantly alert to all effects, direct or indirect, on other components, assemblies or systems caused by such alterations. No alterations should be made to the incomplete vehicle that directly or indirectly results in any either component, assembly or system being in nonconformance with applicable Emission Regulations or Federal Motor Vehicle Safety Standards.

General Motors will honor its warranty commitment (for the cab-chassis only), to the ultimate consumer, provided: (1) the final stage manufacturer has not made any alterations or modifications which do not conform to any applicable laws, regulations or standards, or adversely affect the operation of the cab-chassis; and (2) the final stage manufacturer complied with the instructions contained in this guide with respect to the completion of the vehicle. Otherwise, the warranty becomes the responsibility of the final stage manufacturer.

The final stage manufacturer is solely responsible for the final certification of the vehicle and for compliance with Emission Control and Federal Motor Vehicle Safety Standards. The information contained in this guide has been provided for the final stage manufacturer's information and guidance.

This guide contains information pertaining to the:

Diesel Models: 4500HD Regular Cab Diesel, 4500XD Regular Cab Diesel, 5500HD Regular Cab Diesel 5500XD Regular Cab Diesel

4500HD Crew Cab Diesel, 4500XD Crew Cab Diesel, 5500HD Crew Cab Diesel, 6500XD Diesel Chassis Cab

2024 Chevrolet Low Cab Forward CAUTIONARY NOTES:

Electrical Sensitivity and Battery Relocation Warning

The Low Cab Forward Trucks are sensitive to poor electrical integrity of the starting circuit when compared to previous year models. This is due to the ever increasing electrical demands from the base vehicle that includes the new emissions componentry as well as more sophisticated engines and transmissions. The control modules for these devices require healthy electrical circuits without significant voltage drops through the supply and return circuits.

A relocation or modification of batteries coupled with insufficient wire gauge, poor terminal crimps, weak conductivity to frame rails, terminal corrosion, or loose bolts, could contributed to a possible no start condition.

All Fluids and Lubricants Caution

Any fluids or lubricants added to the chassis during the final manufacturing process must meet GM's fluids and lubricants specifications. These fluids and lubricant specifications vary based on model year and chassis model code. A recommended fluids list based on model and model year can be found in the Vehicle Owner's Manual.

Low Speed Applications for LCF Series Chassis

Any low speed vehicle applications using the Aisin Transmission such as sweeper, highway striping and road side mowing airport service must adhere to the following guidelines in order to prevent the over heating of the automatic transmission fluid.

FACTORY RECOMMENDATION:

Select Range 1 for low speed operations under 11 mph, (18km/h). Select Range 2 for low speed operation under 22 mph, (36km/h).

Auxiliary Transmission Cooler Warning

Installation of Auxiliary automatic transmission fluid cooler will void warranty on transmission/engine.

Transmission Temperature Warning Lamp

Automatic transmission fluid temperature warning lamp illuminates over 140 Centigrade/284°Fahrenheit.

Fuel Tank Caution

Fuel fill kit must be installed on cab chassis if it will be driven for an extended distance. (Note: fuel tank kit provides venting for the fuel tank)

Tapping into Engine Cooling System

Do not connect any auxiliary heating devices to the chassis cooling system. The chassis cooling system is part of the vehicle emission system and is used to thaw DEF fluid and meet mandatory emission thaw times.

Brake Override Logic

The ECM logic has adopted Brake Override Logic that will reduce engine RPM to idle RPM when the brake and accelerator pedals are applied simultaneously. This ECM logic has been adopted to enhance the safe operation of the vehicle. The brake override logic disables the accelerator pedal input and protects against vehicle malfunction in cases where the accelerator pedal and brake pedal are operated simultaneously, or if unintended driver acceleration pedal operations are detected.

1.2

NO-START CONDITION – CLICKING OR BANGING FROM STARTER

LCF Trucks Equipped with 5.2L (4HK1) Diesel Engines

It is possible to experience a no-start condition accompanied by a clicking or banging-type noise from the starter. This condition presents itself when vehicle battery voltage is low. The insufficient voltage/current will cause an improper ground for the X-17 starter relay. As a result, the starter will not remain engaged to start the engine. This is not an indication of a defective starter, alternator or ECM.

The following is a list of common causes for low battery voltage. Inspect these items as possible causes for the described condition before further diagnosis.

- 1. Extreme low ambient temperatures (below 10°C / 50°F). The chemical reactions inside of batteries take place more slowly when the battery is cold. The vehicle systems therefore have less energy to work with when it tries to start the engine.
- 2. Vehicles stored for long periods without proper battery charging and maintenance.
- 3. Batteries that have been relocated further away from the starter than the original designed location.
- 4. Batteries or battery cables that have been replaced with improper gauge.
- 5. Corroded battery terminals and cables.
- 6. Vehicles that are started and stopped multiple times without allowing the charging system to replenish the batteries' charge.
- 7. Excessive use of electrical equipment such as electric lift gates.
- 8. Interior and exterior lighting left "On" without the engine running.

NOTE: Do not diagnose starters, alternators, ECMs or other no-start conditions prior to ensuring the battery is fully charged and none of the above common causes exist

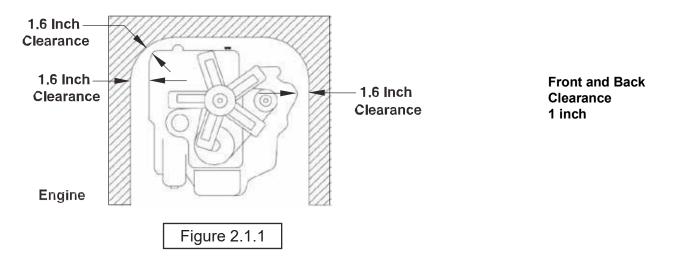

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

<u>Clearances</u>

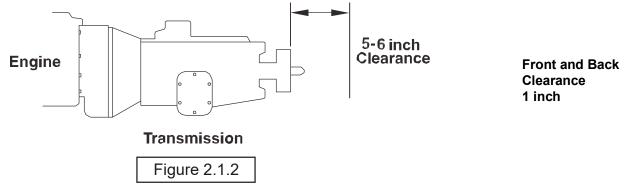

Engine

At least 1.6 inches of clearance should be maintained around the engine. No obstacles should be added in front of the radiator or intercooler.

Transmission

The transmission is removed from the rear. Enough clearance must be provided to allow rearward movement of the transmission assembly. Clearance should be sufficient to allow 5 to 6 inches of unrestricted movement of the transmission assembly. In addition, provide at least 2 inches of clearance around the control lever on the side of the transmission to allow free movement without any binding.

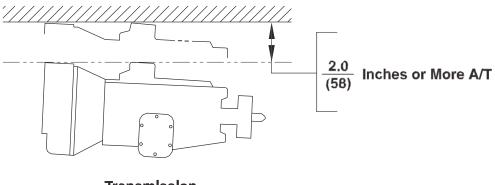

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

<u>Clearances</u>

At least 2 inches of clearance should be maintained above the automatic transmission to allow for transmission removal.

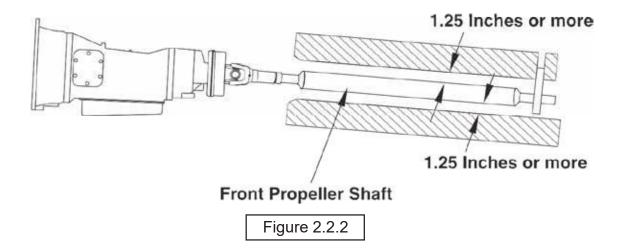

Transmission

Figure 2.2.1

Front and Center Propeller Shafts

At least 1.25 inches of clearance should be maintained around front and center propeller shafts.

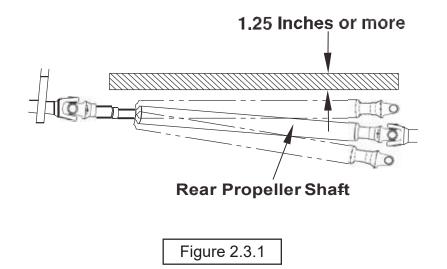

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

<u>Clearances</u>

Rear Propeller Shaft

With the rear springs at maximum deflection, at least 1.25 inches of clearance should be provided over the rear propeller shaft.

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

Clearances

Exhaust System

The exhaust system has a crucial role in meeting 2010 EPA regulations. In order to maintain compliance with the 2010 EPA emissions levels the Diesel Particulate Filter (DPF) and SCR package must not be moved. The distance between the engine exhaust manifold down pipe and Diesel Particulate Filter (DPF) / Selective Catalytic Reduction Package (SCR) must be maintained and the pressure in the system must be sustained at a constant level. Due to increased temperatures in the exhaust system during the regeneration cycle and the heat stress caused by these temperatures, body builders should closely evaluate the placement of equipment and provide protection to these added components as needed.

Diesel Particulate Filter and Selective Catalytic Reduction (SCR) Restrictions

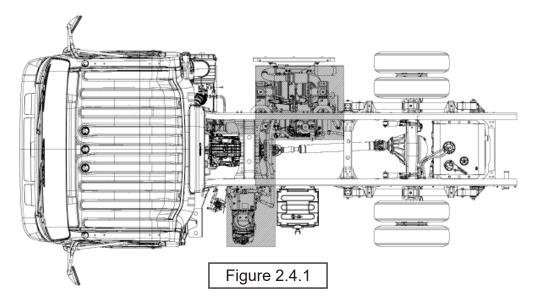

The DPF/SCR has exhaust pressure pipes and temperature sensors. Care must be taken when a body is installed so as to not damage pipe sensors.

The DPF/SCR should be free from impact or vibration during body installation. The DPF/SCR must have enough room for disassembly of the unit for service and cleaning.

The DPF/SCR switch in the cab should not be removed or disabled. No modification or relocation of the DPF/SCR unit, pressure pipes, and sensor is permitted.

No Modification Zones

The **DPF/SCR** unit **CAN NOT** be modified or moved . The **DEF** tank and pump **CANNOT** be modified or removed. **DEF** lines and coolant lines **CANNOT** be modified or rerouted.

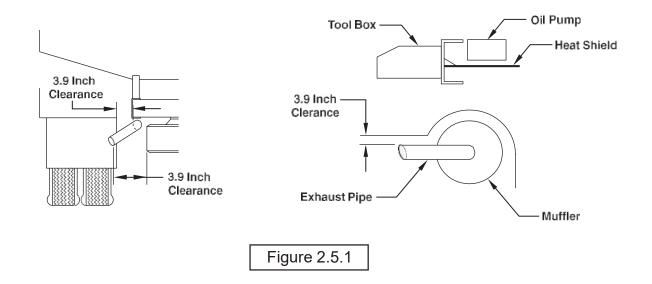

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

<u>Clearances</u>

Exhaust Clearances

If flammable materials such as wood are used in the body, provide at least 3.9 inches of clearance between the body and any parts of the exhaust pipe, DPF/SCR Package. If it is impossible to maintain the minimum clearance, use a heat shield. Also use a heat shield if an oil pump or line is located above the exhaust pipe, muffler or catalytic converter.

 Clearances around SCR system components must be greater than 1.0 inch at all times to avoid potential contact between the body and the exhaust components. The 1.0 inch allows for thermal expansion and assembly tolerance of the exhaust system. It does not account for dynamic movement in the body due to road conditions and other loads. Body companies are instructed to adjust this 1.0 inch clearance as required to account for body displacement while driving. This guidance does not supercede guidance or exhaust clearances for temperature sensitive or flameable components.

2) Exhaust temperatures have not changed since the introduction of DPF in 2007.

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

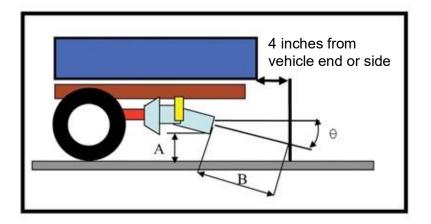

<u>Clearances</u>

Exhaust system surface temperatures During Manual Regeneration

LCF Diesel Modification Guideline (heat issue)

(EXHAUST PIPE HEAT)

During the DPF regeneration cycle, exhaust gas temperatures are hot. Therefore, care should be exercised in placement of the pipe's end location and angle. Do not locate any body parts around the exhaust pipe's end area.

2024 Chevrolet LCF

Figure 2.6.1

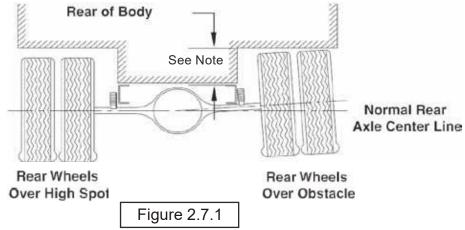

INSTALLATION OF BODY AND SPECIAL EQUIPMENT

Clearances

Rear Wheel Axle

The design and installation of the body should allow sufficient clearance for full vertical movement of the rear wheels and axle when the vehicle travels over rough or unlevel surfaces.

Note: For recommended clearances, please refer to the Rear Axle Chart in each model's respective section.

Other Clearances

The transmission control cable may be broken if it is bent by or interferes with the body and its fixtures. To prevent this, 1 inch of minimum clearance should be provided. When cable is detached from body mounting, be sure not to bend the cable.

Accessibility to the grease nipple on the rear spring bracket/shackle should be provided so that serviceability with a grease gun is not hampered.

Parts	Minimum Clearance	Location
Brake Hose	6.7 in.	Axle Side
	1.6 in.	Frame Side
Parking Brake Cable	1.2 in.	—
Fuel Hose	1.6 in.	—
Shock Absorber	2.4 in.	Axle Side
	1.2 in.	Frame Side

Body Installation

Mirrors

The Chevrolet LCF series chassis will accommodate up to 96 inch wide bodies without modification to the mirror brackets.

The Chevrolet 4500HD, 4500XD, 5500HD and 5500XD chassis will accommodate up to 96 inch wide bodies without modification to the mirror brackets. Bodies from 97 to 102 inches wide will require that the mirror brackets be modified. This Modification can be made at the port and the vehicle order/label will indicate a Regular Product Option of TBD indicating "Mirror Bracket for 102 wide body". The brackets can also be modified by the GM Chevrolet Dealer or the Body Company by installing mirror brackets ordered from General Motors Service.

Side Step Door Installation recommendations

Floor of body should be at least 10" above frame rail (2.5" wood + 4" long sill + 3" cross sill + 1.125" floor)

Forward end plate of step well area can interfere with SCR system

All body components should maintain a minimum 1.0" of clearance to exhaust components UNDER ALL (DYNAMIC) CONDITIONS. (Body company will need to add to this 1.0" clearance to account for flex or movement in the body)

Outer heat shield on SCR system can be removed prior to mounting body if required for clearance Care should be taken to adequately shield exhaust

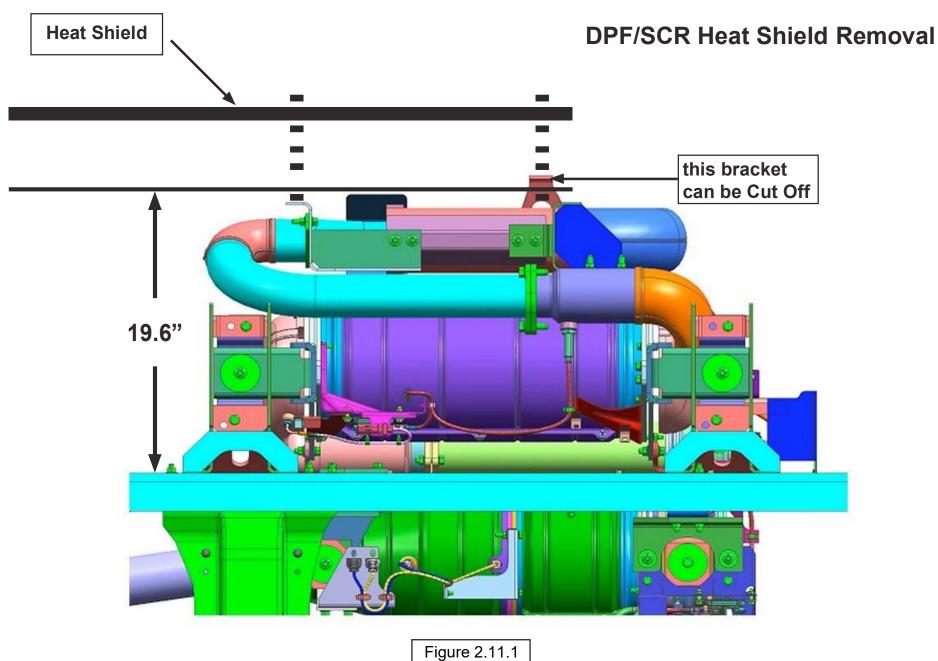

Driver's side steps can also be accommodated, if door is located behind DEF tank Battery may have to be relocated, depending on door location

Access hatch for DEF tank fill may have to be added, depending on door location

DPF/SCR Heat shield Removal

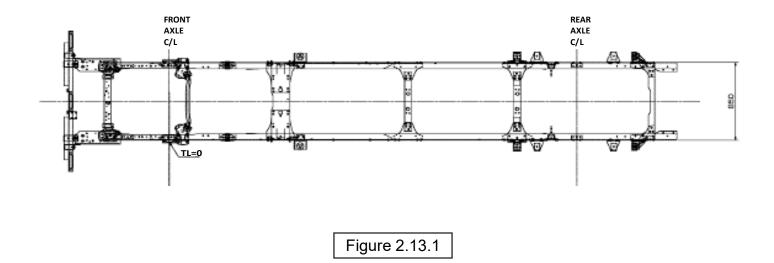

The exhaust external heat shield does not impact vehicle emissions or emissions system durability. This shield can be removed or modified in order to facilitate body or equipment mounting, but the completed vehicle manufacturer should ensure that, when completed, the exhaust will be adequately shielded to prevent unintentional contact with hot exhaust components, and that heat transfer to body components is not so high as to present safety or durability risks. www.gmupfitter.com

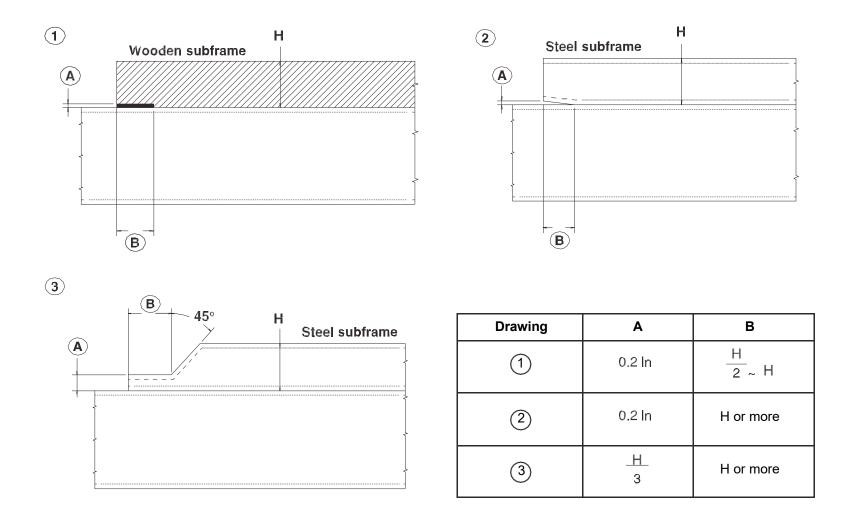

LCF 4500HD, 4500XD, 5500HD, 5500XD

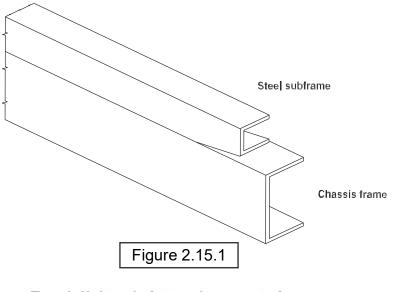

Subframe Contour

Contouring of the front end of the subframe members as shown in the three illustrations below will prevent stresses from being concentrated on certain areas of the chassis frame

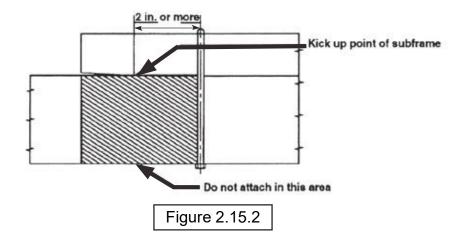

When using a steel subframe, do not close the end of the subframe.

Prohibited Attachment Areas

Do not attach the subframe with a bolt or bracket to the chassis frame at the points indicated in the following illustrations.

1. At the front end of the subframe. The attaching bolt or bracket must be at least 2 inches behind the kick up point of the subframe.

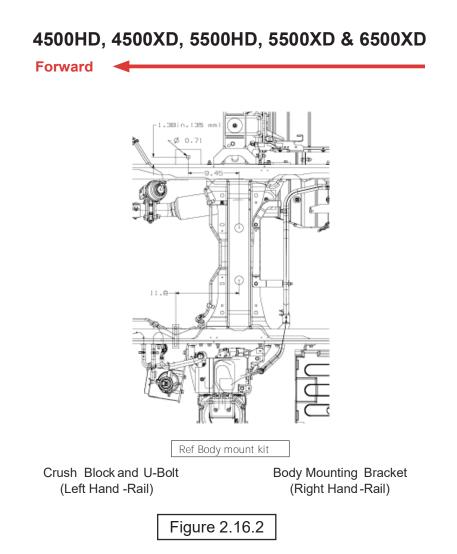

Prohibited Attachment Areas

2. Front U-bolt and Mounting Bracket, Mounting Locations Ahead of Transmission

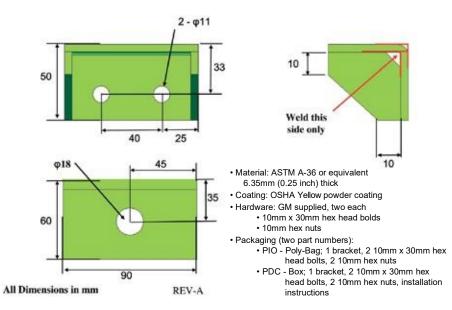

Mandatory location due to after treatment device location and interior frame components. The chassis will be supplied with one steel crush block in cab for left hand forward body attaching location as illustrated in the drawings below and one body mounting bracket (painted yellow) attached to the right hand frame rail in the location shown in the drawings below. Body Builder will be required to design a mating bracket for attaching the body to the yellow painted chassis body mounting bracket (Ref page 2.16 for illustration of bolt clamping 2 brackets). No U bolt type attaching allowed.

U-Bolt Placement – 150" W/B Crew Cab

Front, RHS U-bolt on 150" Wheelbase Crew Cab interferes with after treatment system. General Motors will supply body mounting bracket on chassis to facilitate body mounting on the passenger side of the vehicle as Illustrated.

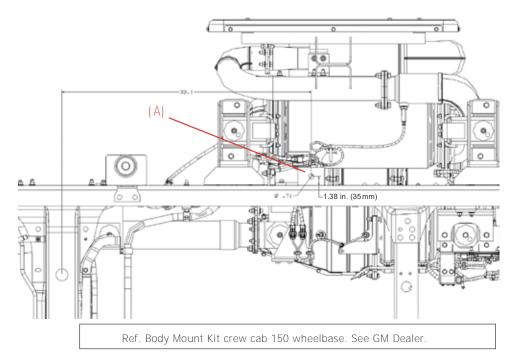

CREW CAB 150" WB

Body Mounting Bracket (A) Dimensions

Body Mounting Bracket will be painted "YELLOW" for easy identification

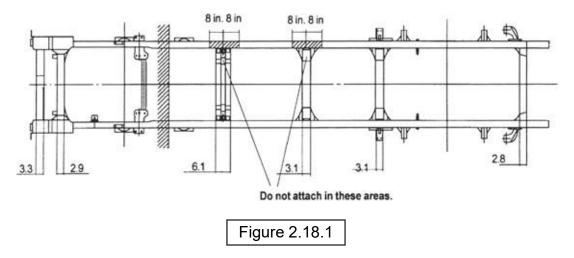

CREW CAB 150" WB

Body Mounting Bracket (A) Location

Figure 2.17.2

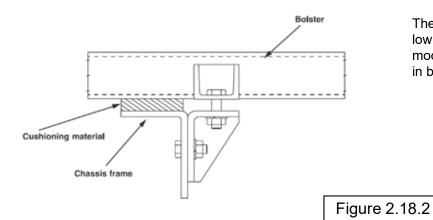

Subframe Mounting

Within 8 inches of bends in the chassis frame or the attachment points of any crossmembers.

Bracket Installation

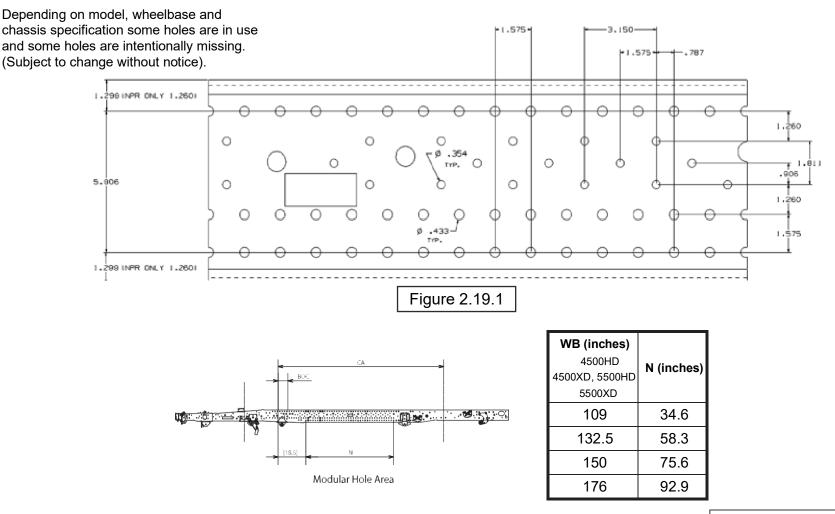

Mounting brackets should be clamped to the chassis frame using bolts. For proper positions in which to install the bolts, refer to the preceding section and the section "Modifications to the Chassis Frame." In addition to the illustrated bracket and U -bolts a shear plate may be required for adequately body mounting. The body company will be responsible for engineering their own mounting system.

The frame material is a heat treated, carbon manganese, low alloy steel with good weldability. The frame has a 80/40 mm modular hole spacing standard. This standard pattern will assist in body mounting.

MODULAR FRAME HOLE PATTERN

The frame material is a heat treated carbon manganese, and low alloy steel with good welding characteristics. The frame has an 80/40mm modular hole spacing standard. This standard pattern will assist with body mounting.

Note: Re-tighten all attaching parts that are loosened during body installation.

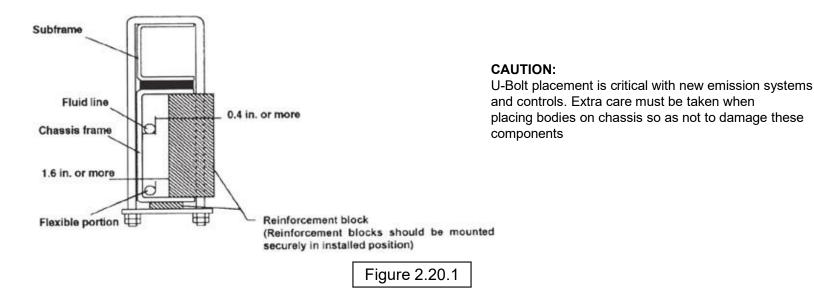

Figure 2.19.2

U-bolt Installation

When U-bolts are used to retain the subframe, reinforcement blocks must be installed in the frame members. This will prevent distortion of the frame flange as they are tightened. The drawing indicates the correct placement of reinforcement blocks. If you use wood blocks, be sure that there is sufficient clearance between them and any parts of the exhaust system. The use of J-bolts to retain the subframe is strictly prohibited.

If any fluid lines or electric cables are located near the reinforcement blocks, you must provide at least 0.4 inches of clearance between rigid or stationary portions, and at least 1.6 inches between moveable or flexible portions of the lines.

For the installation positions of the U-bolts, refer to "Prohibited Attachment Areas."

Crew Cab Body / Frame Requirements

The Crew Cab 4500, 4500HD, 4500XD, and 5500HD will be available in two wheelbases, 150 and 176 inches. CA will be 88.5 and 114.5 inches. On this model chassis, General Motors will require that the body installed on the chassis have an understructure manufactured with any of the following structural steel "C" channels:

4" x 1-5/8", 7.5 lb./ft. 5" x 1-3/4", 6, 7 or 9.0 lb./ft. 6" x 2", 8.2, 10.5 or 13 lb./ft.

Modification of the Frame

Modifications of the chassis frame should be held to an absolute minimum. Modification work should be performed according to the instructions in the following paragraphs.

When modification is complete, chassis frame members should be carefully inspected to eliminate the possibility of any safety-related defects.

NOTE: PLEASE REFER TO NOTES ON CHASSIS FRAME MODIFICATION WITH ANTILOCK BRAKES.

Working on Chassis frame

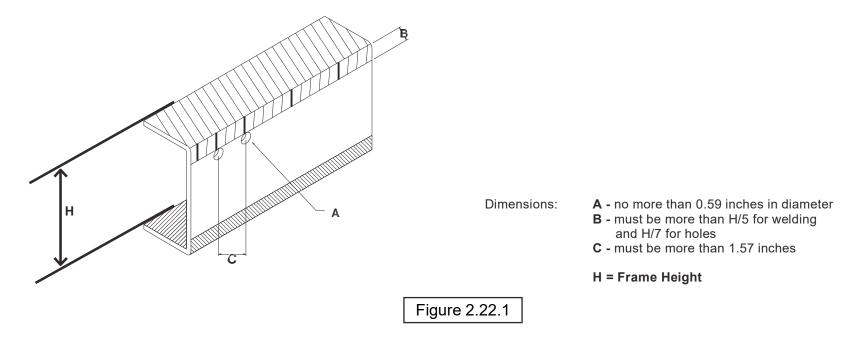

The chassis frame is designed and built with consideration for proper load distribution. Sufficient physical strength is provided when the load is evenly distributed. Installation of special equipment on the chassis frame can cause variations in load distribution. If even distribution of load is not kept in mind when the equipment is installed, localization of stresses on specific areas of the frame could cause cracking of the chassis frame members or other problems, even if the total weight of the equipment is within the design limit.

The chassis frame is designed as an integral unit. Therefore, we do not recommend cutting the chassis frame under any circumstances.

Drilling and Welding

IMPORTANT NOTE: For vehicles equipped with electronic engines and or electronic or hydra-matic transmissions, electric arc welding must be done with the negative battery cable disconnected.

- 1. Do not drill or weld in the shaded portions of the chassis frame members. Do not weld within 0.8 inches from the edges of any existing holes. (Ref. page 2.20)
- 2. Hold the length of any welding beads within 1.2-2.0 inches. Allow at least 1.6 inches between adjacent welding beads.
- 3. All holes must be drilled. Do not use a torch to make any holes.
- 4. All riveting must be done with cold rivets. Do not use hot rivets.
- 5. The flange of the chassis frame must not be cut under any circumstances.
- 6. The subframe must be attached to the chassis frame with bolts. Do not weld.
- 7. Repaint exposed metal after drilling.

Reinforcement of Chassis Frame

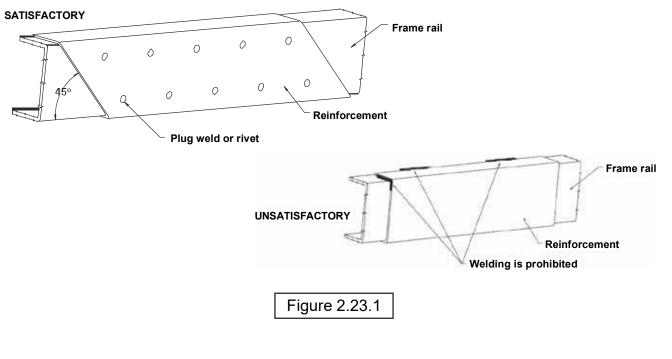

Reinforcements must be installed to prevent the considerable variation in the section modulus. They must be welded so as to avoid localized stresses.

The frame of the LCF is made of SAPH440 mild steel.

The drawing on the following page illustrates correct and incorrect methods of frame reinforcement.

Welding

- 1. Keep reinforcement plates and chassis frame free from moisture and water.
- 2. Avoid cooling with water after welding.
- 3. Use a suitable means to protect pipes, wires, rubber parts, leaf springs, etc. against heat and effect of sputtering.
- 4. Remove fuel tank assembly when welding portions near the fuel tank.
- 5. Remove coat of paint completely when welding painted areas. Repaint exposed metal after welding.

Fluid Lines

Do not disturb the layout of any brake lines or fuel lines unless absolutely necessary. When modification is needed, follow the instructions below carefully to ensure safety. Brake fluid lines must not be cut and spliced under any circumstances. We do not recommend the cutting or splicing of any fuel lines, but if it is absolutely necessary, be sure that the correct fitting and tools are used to form the joint, and then pressure test the joint. Steel lines are metric sizes.

Preparation of Additional Lines

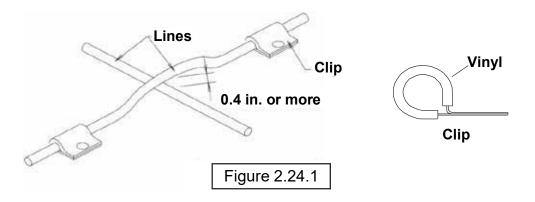

- 1. Where possible, use only genuine GM lines as supplied by authorized GM Chevrolet dealers.
- 2. Use the correct metric flaring and bending tools to form the lines.
- 3. Avoid repeated bending. Do not use heat for flaring and bending the lines. Before and after forming the new lines, examine them carefully for scratches, distortion, dents and the presence of any foreign matter.

Installation of Additional Lines

Install new lines away from adjacent parts and away from any sources of heat.

- 1. A minimum clearance of 0.4 inches must be maintained between lines. Where necessary, clip the lines into position in order to maintain this minimum clearance.
- 2. Minimize any crossing between lines. If a crossing is unavoidable, use the following procedure:
 - a. At least 0.4 inches of clearance should be maintained between lines at the crossing point.
 - b. If the 0.4 inches of clearance cannot be maintained, or if the lines are subject to vibration, clip them securely.
- 3. Plan the bends and clipping points of the lines to minimize vibration and the resulting fatigue.
- 4. Use rust-proofed clips and apply vinyl coating to the portions of the lines to be clipped.
- 5. Install new lines in positions where they are protected against water, dirt, grit, sand, rocks and other foreign matter that can come from above or below, or can be flung up by the wheels.

Electrical Wiring and Harnessing

To increase the reliability of the wiring, all frame harnesses are covered with corrugated vinyl tubing. The following instructions apply to extending or modifying these harnesses. See the Electrical Section for information on commonly used circuits in the 3500, 3500HD and 4500, 4500HD, 4500XD, 5500HD, amd 5500XD.

Electrical Wiring and Harnessing

Wiring

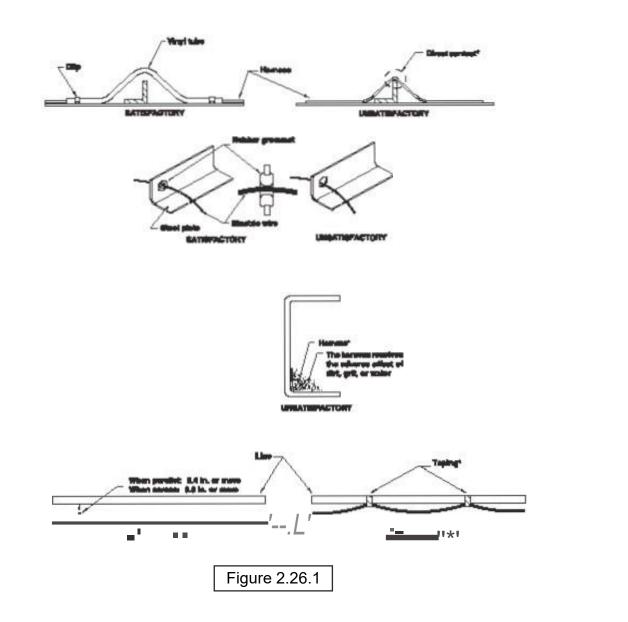

- 1. Most wiring connections on Chevrolet LCF vehicles are made with terminals. We recommend the use of terminals when splicing cables and wires.
- 2. When splicing, use new wire of the same gauge, and do not make splices inside the corrugated tubing.
- 3. When making connections to the end of the harness, make sure the connections are electrically perfect. Use insulating tape as needed to prevent the entry of water, which results in short circuits and/or corrosion.
- 4. When making new circuits, or modifying circuits already installed, make the cables only just taut enough to remove any slack. Use clips or grommets where required to protect cables from heat or sharp edges. When cables must run near the exhaust system, see the instructions in the "Exhaust System" section.
- 5. Always use rustproof clips, and apply vinyl coating to that portion of the clips in direct contact with the harnesses. No scotch clips or connectors.
- 6. To minimize the vibration of the harness, clipping points should be set up according to the table.

Harness Diameter	Clip Distance
less than 0.2 in.	less than 11.8 in.
0.2 in. ~ 0.4 in.	approx. 15.7 in.
0.4 in. ~ 0.8 in.	approx. 19.7 in.

Figure 2.25.1

- 7. When changing the length of the battery cable, do not cut or splice the existing cable. Make up a new cable of the correct length and wire gauge for the load and distance, without splices.
- 8. When using connectors, use a socket (female) connector on the electrical source side and a plug (male) connector on the electrical load side to lower the possibility of a short circuit when disconnected.
- 9. When connecting cables to moving or vibrating parts such as the engine or transmission, be sure to maintain sufficient slack in the wiring to absorb the vibration. Follow the example of existing cables connected by General Motors. Keep flexible cables clear of other parts.
- 10. Do not use vinyl tape in the engine compartment. The heat will tend to make it peel off. Use plated steel clips coated with rubber or vinyl.
- 11. When locating auxiliary equipment or lines near the ECM caution should be used in order to protect the ECM from excessive vibration, heat or chemical reactions.

Electrical Wiring and Harnessing

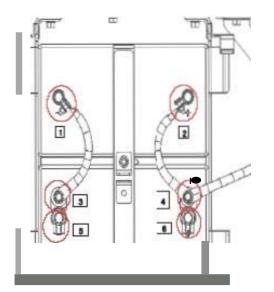

Figure 2.26.2

2.26

Electrical Wiring and Harnessing

Wire Color Code

The electrical circuits of the Chevrolet LCF Chassis Cab are connected with low-voltage stranded wire for automotive applications. The color coding standards are as follows for the Chevrolet LCF Chassis Cab:

- (1) Black (2) White
- B Starter circuits and grounds
- W Generator (alternator) circuit
- R Lighting circuit
- (3) Red (4) Green
- G Signal circuit

- (5) Yellow
- (6) Brown
- (6) Brown(7) Light Green
- (8) Blue
- Y Instrument circuit
- Br Accessory circuit
- Lg Other circuit
- L Windshield wiper motor circuit

Maximum Allowable Current

Harness Design Diameter (mm)	AWG Equivalent	No. of Wires/Wire Diameter (mm)	Cross Sectional Area (mm2)	Maximum Allowable Current (Amps)
100	00	217/0.80	109.1	363
85	0	169/0.80	84.96	305
60	1	127/0.80	63.84	248
50	1	108/0.80	54.29	223
40	1	85/0.80	42.73	191
30	2	70/0.80	35.19	171
20	4	41/0.80	20.61	123
15	6	84/0.45	13.36	93
8	8	50/0.45	7.952	68
5	8	65/0.32	5.228	51
3	12	41/0.32	3.297	39
2	14	26/0.32	2.091	29
1.25	16	16/0.32	1.287	21
0.85	18	11/0.32	0.8846	17
0.5	20	7/0.32	0.5629	13

Reference: The values given in the "maximum allowable current" column are based on the ambient temperature condition of 104°F with temperature increase of 104°F.

Figure 2.27.1

Electrical Wiring and Harnessing

Electrical System Modifications

Modifications/add-on wiring must be carefully reviewed to ensure compatibility with the base vehicle wiring by reviewing system schematics, wire routing paths, harness connections, etc. Due to the wide range of modifications that may be required for vocational needs, it is not feasible for the O.E.M. to take into account all potential revisions. For this reason, any person modifying existing vehicle wiring must assume responsibility that the revisions have not degraded the electrical system performance. Any add-on wiring needs to be properly fused and routed to prevent cut, pinch, and chafe problems, as well as avoid exposure to excessive heat. Care must be exercised that existing vehicle interfaces do not have their current load capabilities exceeded, and that the respective control devices are not overloaded. Added wire size should be at least as large as the wire to which it is attaching in order for fuse protection to be maintained

A Packard electric wiring repair kit is available through Kent-Moore (P/N J38125-B) (Phone # 1-800-345-2233). This kit contains instructions, tools and components for making repairs to wiring harness components. This kit would also greatly assist in accomplishing necessary add-on wiring such as body marker lamps, so that system reliability/durability is maintained.

Electrical wiring components can be obtained through your authorized Chevrolet dealers. Packard Electric components are also available through Power and Signal (www.powerandsignal.com). Power and Signal may also be able to assist in making necessary wiring additions by providing custom wiring stubs or jumpers to your specifications.

Caution: Before servicing any electrical component, the ignition key must be in the LOCK position and all electrical loads must be OFF, unless instructed otherwise in GM service procedures. If a tool or equipment could easily come in contact with a live exposed electrical terminal, also disconnect the negative battery cable. Do not disconnect cable within 3 minutes after turning the ignition key to the Lock position. Failure to follow these precautions may cause personal injury and/or damage to the vehicle or its components.

Electrical Caution: Please see note in Section 1 Introduction on page 1.9 of on the subject of "NO-START CONDITION – CLICKING OR BANGING FROM STARTER 2012-2015MY Chevrolet LCF Equipped with 5.2L (4HK1) Diesel Engines".

Exhaust System

Modification of the exhaust system should be avoided. If modifications are absolutely necessary, the following points should be maintained.

1. Maintain the clearance specified in the "Exhaust System" table between all parts of the exhaust system and any fuel lines, brake lines, brake hoses, electrical cables, etc. The exhaust outlet should not point toward any of these parts.

	Clearance
Brake lines	2.4 in. or more. (If the combined section of a group of parallel brake lines is more than 7.8 in., a clearance of 7 in. or more should be provided.)
Flexible brake hoses	7.8 in. or more. (The temperature of flexible brake hoses should not exceed 158°F. If the highest temperature is not measurable, a clearance of more than 15.7 in. should be maintained between the hoses and the exhaust system.)
Wiring harnesses and cables	7.8 in. or more. (The temperature of flexible brake hoses should not exceed 158°F. If the highest temperature is not measurable , a clearance of more than 15.7 in. should be maintained between the hoses and the exhaust system.)
Steel fuel lines	3.1 in. or more.
Rubber or vinyl fuel hoses	5.9 in. or more.

Exhaust System

- 2. If a tool box is installed, it should preferably be made from steel. If a wooden tool box is installed, at least 7.8 inches of clearance should be maintained between the tool box and any parts of the exhaust system.
- 3. If the exhaust system is modified, it is the responsibility of those making the modification to ensure that the noise level meets appropriate standards.
- 4. If the exhaust system is modified it is the responsibility of those making the modification to ensure that the emission levels meet appropriate standards.

Fuel System

Relocation of the fuel tank, or installation of additional fuel tanks, is not recommended. If modifications to the fuel system are unavoidable, follow these recommendations:

- 1. Maintain adequate clearance between the fuel tank and any other device or structure.
- 2. Do not connect any additional fuel hose.

Rear Lighting

Brackets installed are temporary. Please do not use these brackets for body installation.

Serviceability

No matter what other modifications or changes are made, access to components requiring daily preventive maintenance or other routine service must not be obstructed. This includes:

- 1. Inspection, filling and draining of engine oil and cooling water.
- 2. Inspection, filling and draining of transmission fluid.
- 3. Adjustment, removal and installation of the fan belts.
- 4. Inspection, filling and removal of the battery and battery cover.
- 5. Inspection and filling of brake fluid.
- 6. Inspection and bleeding of the brake system and servo unit.
- 7. Maintenance of clearance for tightening of check bolt on brake safety cylinder.
- 8. Operation of the spare tire carrier, including mounting and dismounting of the spare tire.
- 9. Adjustment, removal and installation of distributor and/or cover.

Wheelbase Alteration

With certain applications, it may become necessary to alter the wheelbase of the chassis. The next two sections provide the suggested guidelines for accomplishing either shortening or lengthening of the wheelbase.

Shortening/Lengthening the Wheelbase Without Altering the Frame

Since the frame is an integral part of the chassis, it is recommended that the frame not be cut if it is possible to avoid it. When shortening/lengthening the wheelbase on some models, it is possible to do so without cutting the frame. This is possible on models which have a straight frame rail. If the chassis does not have a straight frame rail, it may still be necessary to cut the frame. For instructions on shortening/lengthening these chassis, refer to the "Altering the Wheelbase by Altering the Frame" section of this book. Otherwise, the wheelbase may be shortened/lengthened by removing the rear suspension, drilling new suspension mounting holes at the appropriate spot in the frame, and sliding the rear suspension, suspension liner, and suspension crossmembers' rivet holes left in the frame rail flange must be filled with GRADE 8 bolts and hardened steel washers at both the bolt head and nut, HUC bolts or GRADE 8 flanged bolts and hardened steel washers at the nut. When shortening/lengthening the wheelbase in this manner, the following guidelines must be adhered to:

- 1. All frame drilling must comply with the DRILLING AND WELDING section of this book.
- 2. All rivet holes left in the frame rail flange from the suspension and suspension crossmembers must be either filled with GRADE 8 bolts and hardened steel washers at both the bolt head and nut, HUC bolts or GRADE 8 flanged bolts and hardened steel washers at the nut.
- 3. The components required to be slid forward or aft are the suspension and suspension hangers, suspension crossmembers and suspension frame liner.

Altering the Wheelbase by Altering the Frame

Even on a straight frame rail, it may be desirable to cut the frame and lengthen or shorten the wheelbase rather than simply sliding the rear suspension back or forward. The following section offers some guidelines and suggestions for cutting and lengthening or shortening the frame.

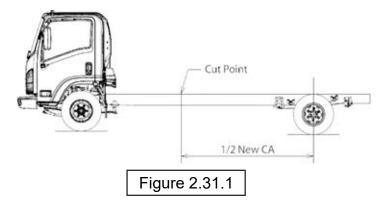

Glossary of Terms – Chassis Wheelbase Alteration

- CA Length from back-of-cab to rear axle centerline in inches.
- AL Added length (in case of a lengthened wheelbase). Difference between WB (new) and WB (old).
- SL Shortened length (in case of shortened wheelbase). Difference between WB (old) and WB (new).

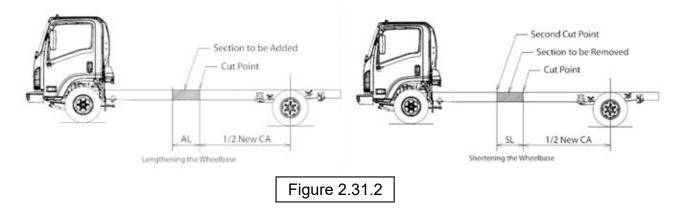

Wheelbase Alteration

- 1. Determine the added length (AL) or shortened length (SL) required to lengthen or shorten chassis. (For added wheelbase: New CA = CA + AL; For shortened wheelbase: New CA = CA SL.)
- 2. Obtain the material to be used as the insert for the lengthened wheelbase in the correct length (AL). The insert must have the same cross sectional dimensions and yield strength as the original frame rail.
- 3. Divide the new CA by two (2). Measure (new CA)/2 from the center of the rear axle forward and mark this point on the chassis frame (see figure below).

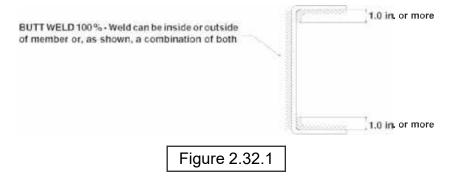

4. Cut the chassis frame at this point. If the wheelbase is to be lengthened, addition of the previously obtained insert (of length AL determined in step 1) will be made at this time. If the wheelbase is to be shortened, measure the distance (SL) forward of this cut and remove a length (SL) section from the chassis frame (see figure below). Ensure that an adequate area on the frame remains for the required addition of the necessary reinforcements. These are the only suggested places for cutting the frame and reinforcements but may be changed upon the advice of GM Upfitters Engineering.

Wheelbase Alteration

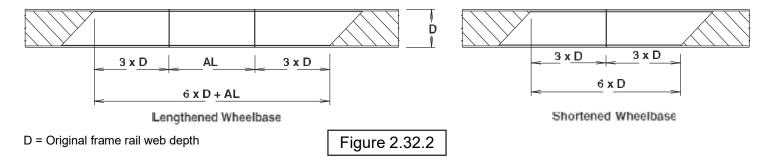

5. When welding the insert (length AL for wheelbase lengthening) to the original frame rail, a continuous butt weld must be used at the splices. When shortening the wheelbase, weld the ends of the chassis frame together with a continuous butt weld over the junction of the frame ends. Weld can be both the inside and outside of the frame rails using welding techniques prescribed by established welding standards (ref. SAE J1147) and in accordance with this guide. An example of this weld is shown below.

6. Determine the appropriate additional internal reinforcements which are required using this equation:

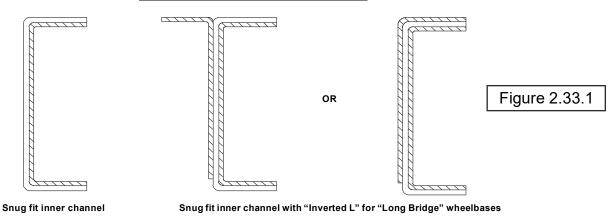

Reinforcement Length = AL + 6 x (original frame rail web depth).

The figure below shows how this reinforcement is to be placed over the extended or shortened section of the frame rail.

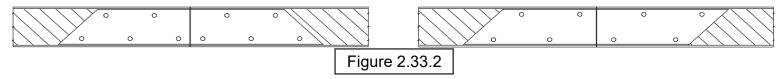

The suggested cross section of this reinforcement is a snug fit inner channel. If the new wheelbase exceeds the upper limit of the optional wheelbases of this model, i.e.; a "long bridge", it may be necessary to use an "inverted L" reinforcement in addition to the snug fit channel reinforcement (see figures on next page). Application Engineering should be consulted for approval of such cases. It should be noted that these methods of reinforcements, and any other methods which may be used, require a 45° angled cut at both ends to avoid stress concentrations in the frame (note the figures under item 7).

Wheelbase Alteration

7. The reinforcements must be fastened securely to only the web of the original chassis frame rail. The reinforcement must be held rigidly in place using either HUC bolts, GRADE 8 bolts and hardened steel washers at both the bolt head and nut, or GRADE 8 flanged bolts and hardened steel washers at the nut. Below are some suggested bolt patterns. It should be noted that these bolt patterns must not align the bolts vertically, i.e.: the bolt pattern must be staggered.

8. Lengthening the frame will also require extending the brake lines, basic chassis electrical harness. It is recommended that the original brake lines be removed and replaced with brake lines of the same diameter as the original lines and of the appropriate length. The extended ABS brake lines must be supported back to the frame to prevent vibration. The electrical harness must be extended in accordance with the ELECTRICAL WIRING AND HARNESSING section of this book. GM offers an electrical extension harnesses for the LCF chassis when a wheelbase is lengthened. One wheelbase longer is the recommended maximum wheelbase extension (please refer to the drive line section and particular models for number of drivelines and their maximum lengths). The extension of a wheelbase will require electrical extension harnesses.

Diesel
```

2016-2019 CHAS WRG HARNESS ASM; QTY 1 (See your GM dealer for parts.) 2016-2019 CHAS RR WRG HARNCLIP; QTY 5 (See your GM dealer for parts.)

9. The propeller shaft's overall length will also need to be lengthened or shortened. If the extension is within the limits of the optional wheelbases of the respective model, the exact propeller shaft lengths and angles are given on or about Page 12 of the respective sections of this book. If the modified wheelbase exceeds the optional wheelbases of the respective model, the following guidelines must be adhered to:

Wheelbase Alteration

a. Propeller Shaft Length

The maximum propeller shaft lengths (pin to pin) for the respective models are shown in the table below.

ENGINE	DIESEL		
MODEL	4500HD	4500XD/5500HD	5500XD
Propeller Shaft Diameter (in.)	3.25	3.54	3.54
Maximum Propeller Shaft Length (in.)	50.7	52.9	52.9

Figure 2.34.1

b. Propeller Shaft Angles

The maximum propeller shaft angles, with respect to the previous shaft, are shown in the table below.

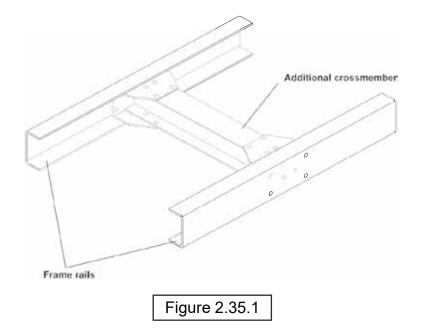

ENGINE	DIESEL		
MODEL	4500HD 4500XD/5500HD 5500XD		
Maximum Propeller Shaft Angle	6.1°	6.1°	6.1°

Figure 2.34.2

- c. The propeller shaft angles must be designed such that the angles will cancel to avoid propeller shaft whip.
- d. The propeller shaft yokes must be assembled such that the propeller shaft yokes are "in phase."
- 10. Extending the frame will also require relocation and/or addition of crossmembers. If the extension is within the limits of the optional wheelbases of the respective model, the exact crossmember locations and dimensions are given in the respective model sections of this book. If the modified wheelbase exceeds the optional wheelbases of the respective model, the following guidelines must be adhered to:
 - a. The crossmember location will largely be determined by the propeller shaft lengths and where the center carrier bearing locations are for the propeller shaft assembly.
 - b. A crossmember must be located at the front and rear spring hangers of the rear suspension (refer to the appropriate section of this book to see where these suspension crossmembers are to be located).
 - c. The crossmember must be constructed such that it supports both the upper and lower flange on each frame rail (see drawing on next page). A crossmember such as the one on the next page may be constructed, or Chevrolet crossmembers may be obtained from your Chevrolet parts dealer.

Wheelbase Alteration

d. The maximum distance between crossmembers for the respective models is given in the table below.

ENGINE	DIESEL		
MODEL	4500HD 4500XD/5500HD 5500XD		
MaximumDistanceBetweenCrossmembers(in.)	35.7	35.7	35.7
	Figure 2.35.2		

- e. The drilling for any additional holes in the frame rails must comply with the DRILLING AND WELDING section of this book.
- 11. All other aspects of lengthening or shortening the wheelbase must comply with the applicable section of this Body Builder's Guide. For special applications and longer than recommended body lengths, GM Upfitter Engineering must be consulted for approval.
- 12. Please contact GM Upfitter Engineering for guidelines on LCF CHASSIS frame modifications when the vehicle is equipped with an Antilock Brake System.

Gas (6.6L Engine) No Modification Zones

The vehicle exhaust, evaporative system, and fuel tank are integral parts of the evaporative/engine and emission/diagnostic control system and CANNOT be modified or rerouted.

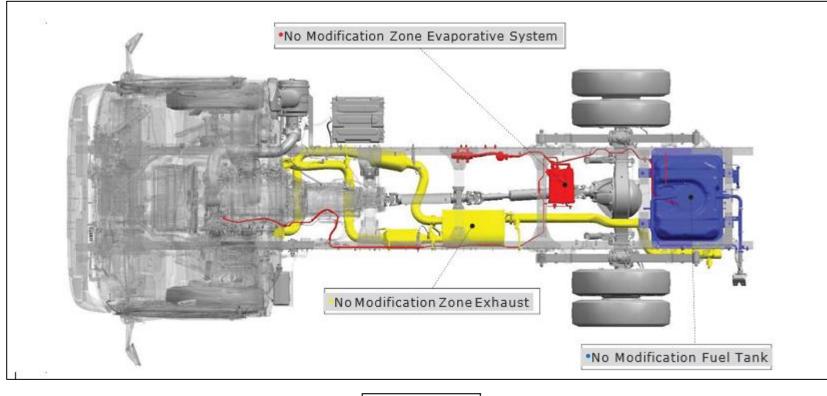

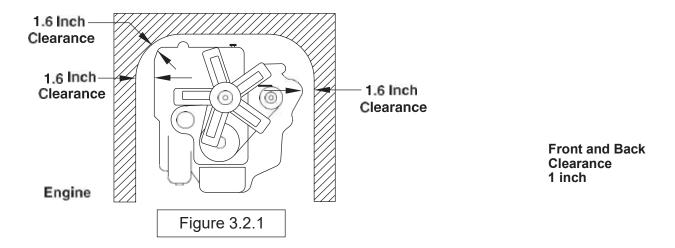

Figure 2.35.3

INSTALLATION OF BODY AND SPECIAL EQUIPMENT 6500XD CLEARANCES

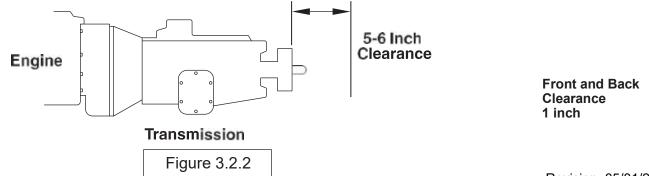

Engine

At least 1.6 inches of clearance should be maintained around the engine. No obstacles should be added in front of the radiator or intercooler.

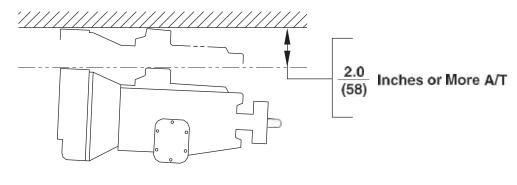

Transmission

The transmission is removed from the rear. Enough clearance must be provided to allow rearward movement of the transmission assembly. Clearance should be sufficient to allow 5 to 6 inches of unrestricted movement of the transmission assembly. In addition, provide at least 2 inches of clearance around the control lever on the side of the transmission to allow free movement without any binding.

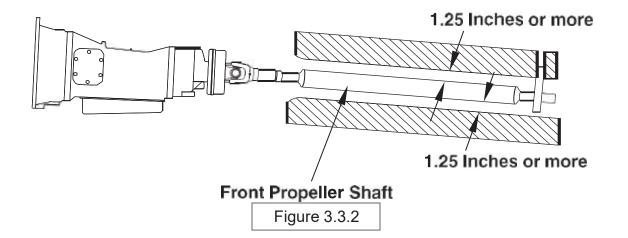

At least 2 inches of clearance should be maintained above the automatic transmission to allow for transmission removal.

Front and Center Propeller Shafts

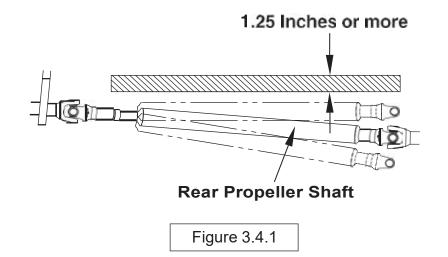

At least 1.25 inches of clearance should be maintained around front and center propeller shafts.

Rear Propeller Shaft

With the rear springs at maximum deflection, at least 1.25 inches of clearance should be provided over the rear propeller shaft.

Exhaust System

The exhaust system has a crucial role in meeting 2010 EPA regulations. In order to maintain compliance with the 2010 EPA emissions levels the Diesel Particulate Filter (DPF) and SCR package must not be moved. The distance between the engine exhaust manifold down pipe and Diesel Particulate Filter (DPF) / Selective Catalytic Reduction Package (SCR) must be maintained and the pressure in the system must be sustained at a constant level. Due to increased temperatures n the exhaust system during the regeneration cycle and the heat stress caused by these temperatures, body builders should closely evaluate the placement of equipment and provide protection to these added components as needed.

Diesel Particulate Filter and Selective Catalytic Reduction (SCR) Restrictions

The DPF/SCR has exhaust pressure pipes and temperature sensors. Care must be taken when a body is installed so as to not damage pipe sensors.

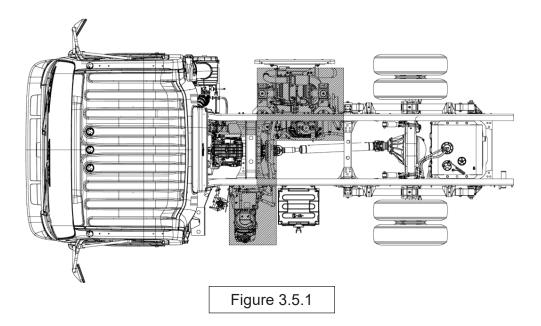

The DPF/SCR should be free from impact or vibration during body installation. The DPF/SCR must have enough room for disassembly of the unit for service and cleaning.

The DPF/SCR switch in the cab should not be removed or disabled. No modification or relocation of the DPF/SCR unit, pressure pipes, and sensor is permitted.

6500XD No Modification Zones

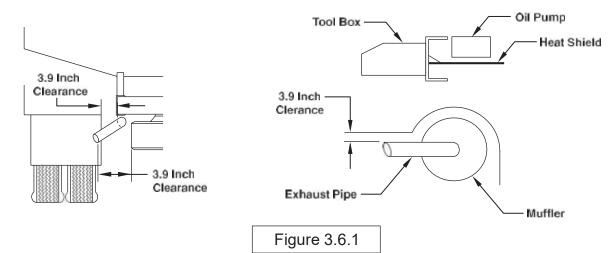

The DPF/SCR unit CANNOT be modified or moved .

The **DEF** tank and pump **CANNOT** be modified or removed. **DEF** lines and coolant lines **CANNOT** be modified or rerouted.

EXHAUST CLEARANCES

If flammable materials such as wood are used in the body, provide at least 3.9 inches of clearance between the body and any parts of the exhaust pipe, DPF/SCR Package. If it is impossible to maintain the minimum clearance, use a heat shield. Also use a heat shield if an oil pump or line is located above the exhaust pipe, muffler or catalytic converter.

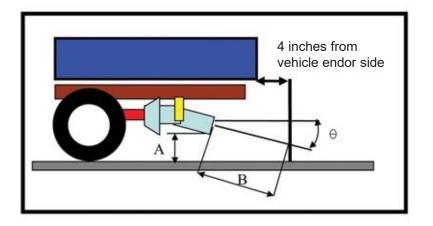

- Clearances around SCR system components must be greater than 1.0 inch at all times to avoid potential contact between the body and the exhaust components. The 1.0 inch allows for thermal expansion and assembly tolerance of the exhaust system. It does not account for dynamic movement in the body due to road conditions and other loads. Body companies are instructed to adjust this 1.0 inch clearance as required to account for body displacement while driving. This guidance does not supersede guidance or exhaust clearances for temperature sensitive or flammable components.
- 2) Exhaust temperatures have not changed since the introduction of DPF in 2007.

Exhaust system surface temperatures During Manual Regeneration

6500XD Modification Guideline (heat issue)

(EXHAUST PIPE HEAT)

During the DPF regeneration cycle, exhaust gas temperatures are hot. Therefore, care should be exercised in placement of the pipe's end location and angle. Do not locate any body parts around the exhaust pipe's end area.

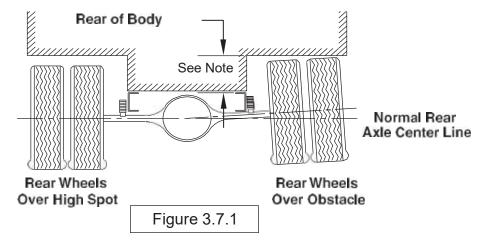

А	В	θ
More than	More than	Less than
8 inches	18 inches	45 deg

Figure 3.7.1

Rear Wheel Axle

The design and installation of the body should allow sufficient clearance for full vertical movement of the rear wheels and axle when the vehicle travels over rough or unleveled surfaces.

Note: For recommended clearances, please refer to the Rear Axle Chart in each model's respective section.

Other Clearances

The transmission control cable may be broken if it is bent by or interferes with the body and its fixtures. To prevent this, 1 inch of minimum clearance should be provided. When cable is detached from body mounting, be sure not to bend the cable.

Accessibility to the grease nipple on the rear spring bracket/shackle should be provided so that serviceability with a grease gun is not hampered.

Parts	Minimum Clearance	Location
Brake Hose	6.7 in.	Axle Side
	1.6 in.	Frame Side
Parking Brake Cable	1.2 in.	—
Fuel Hose	1.6 in.	—
Shock Absorber	2.4 in.	Axle Side
	1.2 in.	Frame Side

Body Installation

Mirrors

The LCF 6500XD chassis will accommodate up to 96 inch wide bodies without modification to the mirror brackets.

The LCF 6500XD chassis will accommodate up to 96 inch wide bodies without modification to the mirror brackets. Bodies from 97 to 102 inches wide will require that the mirror brackets be modified. This Modification can be made at the port and the vehicle order/label will indicate a Regular Product Option of XWL indicating "Mirror Bracket for 102 wide body". The brackets can also be modified by the Chevrolet Dealer or the Body Company by installing mirror brackets ordered from GM Service Parts.

Side Step Door Installation recommendations

Floor of body should be at least 10" above frame rail (2.5" wood + 4" long sill + 3" cross sill + 1.125" floor)

Forward end plate of step well area can interfere with SCR system

All body components should maintain a minimum 1.0" of clearance to exhaust components UNDER ALL (DYNAMIC) CONDITIONS. (Body company will need to add to this 1.0" clearance to account for flex or movement in the body)

Outer heat shield on SCR system can be removed prior to mounting body if required for clearance Care should be taken to adequately shield exhaust

Driver's side steps can also be accommodated, if door is located behind DEF tank

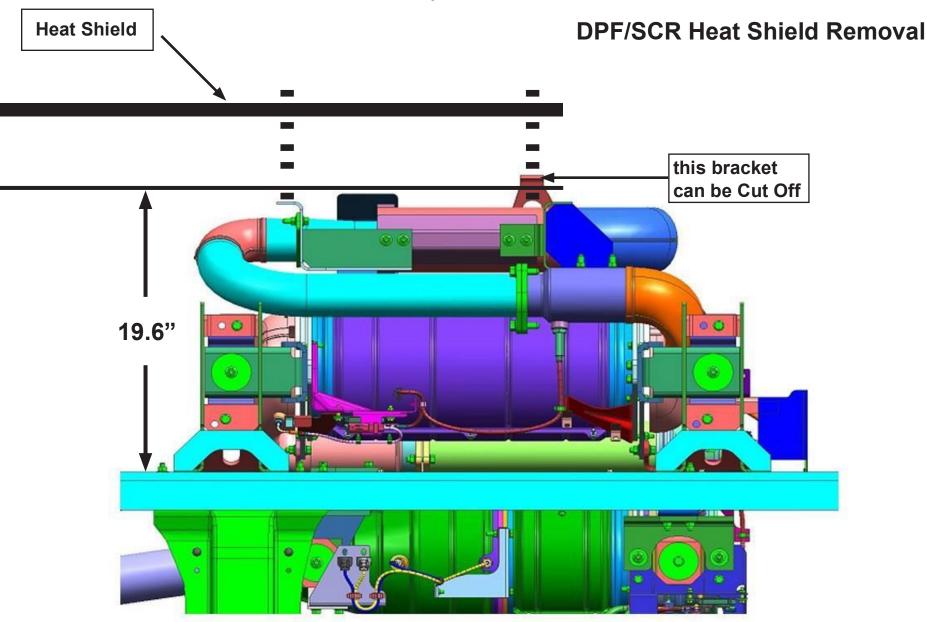

Battery may have to be relocated, depending on door location

Access hatch for DEF tank fill may have to be added, depending on door location

DPF/SCR Heat shield Removal

The exhaust external heat shield does not impact vehicle emissions or emissions system durability. This shield can be removed or modified in order to facilitate body or equipment mounting, but the completed vehicle manufacturer should ensure that, when completed, the exhaust will be adequately shielded to prevent unintentional contact with hot exhaust components, and that heat transfer to body components is not so high as to present safety or durability risks. Detailed information on removal of the heat shield can be found in the GM service manual.

Body Installation

<u>6500XD</u>

Special Equipment on the Chassis

When installing special equipment on the chassis, extra consideration must be given to the weight and construction of the equipment to assure proper distribution of the load. Localization of the load should be prevented. All special equipment should be properly secured into position. We recommend the use of sub frame members when installing special equipment. Sub frame Design and Mounting The sub frame assembly should be mounted as close to the cab as possible. It should be contoured to match the shape and dimensions of the chassis frame as closely as possible.

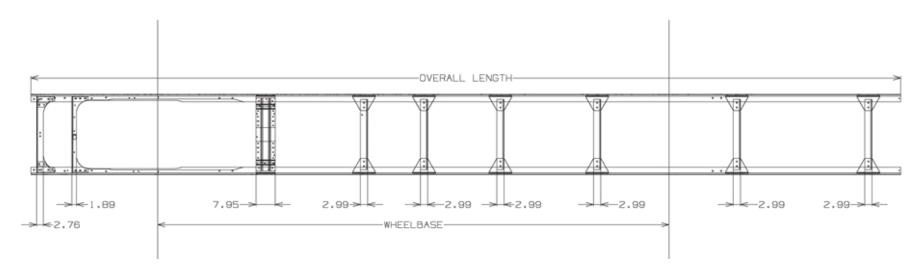

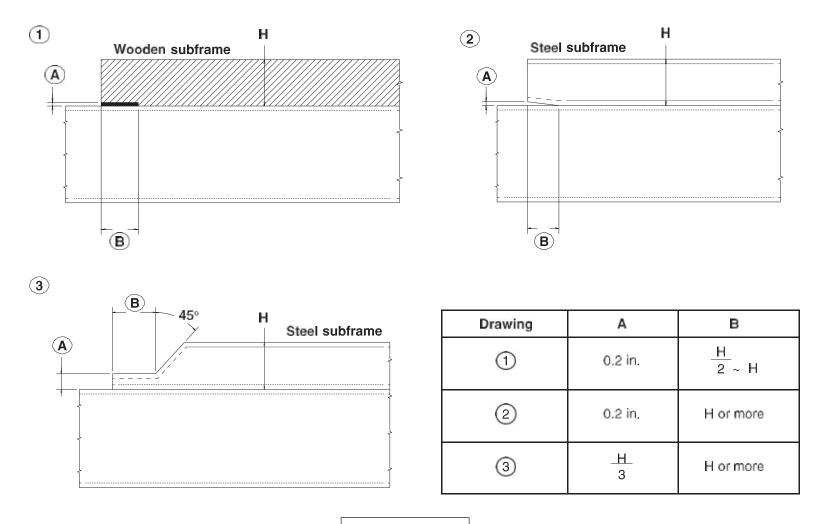

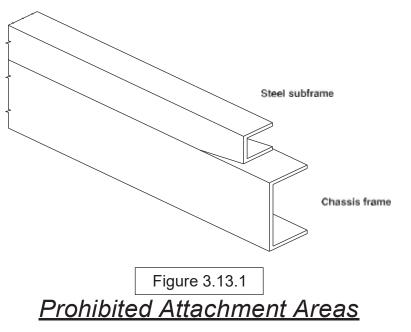

Figure 3.11.1

Subframe Contour

Contouring of the front end of the subframe members as shown in the three illustrations below will prevent stresses from being concentrated on certain areas of the chassis frame.

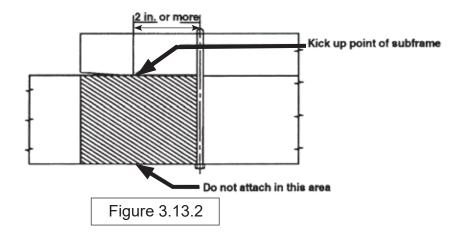

When using a steel subframe, do not close the end of the subframe.

Do not attach the sub frame with a bolt or bracket to the chassis frame at the points indicated in the following illustrations.

1. At the front end of the subframe. The attaching bolt or bracket must be at least 2 inches behind the kick up point of the subframe.

2. Front U-bolt and Mounting Bracket, Mounting Locations Ahead of Transmission

Mandatory location due to after treatment device location and interior frame components. The chassis will be supplied with one steel crush block in cab for left hand forward body attaching location as illustrated in the drawings below and one body mounting bracket (painted yellow) attached to the right hand frame rail in the location shown in the drawings below. Body Builder will be required to design a mating bracket for attaching the body to the yellow painted chassis body mounting bracket (Ref page 2.16 for illustration of bolt clamping 2 brackets). No U bolt type attaching allowed.

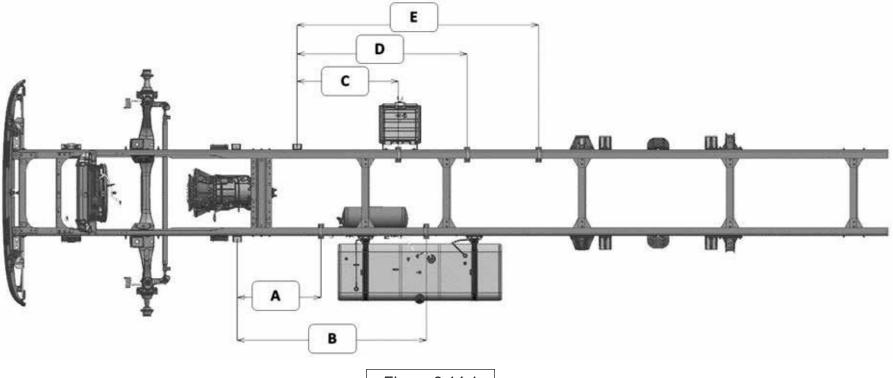

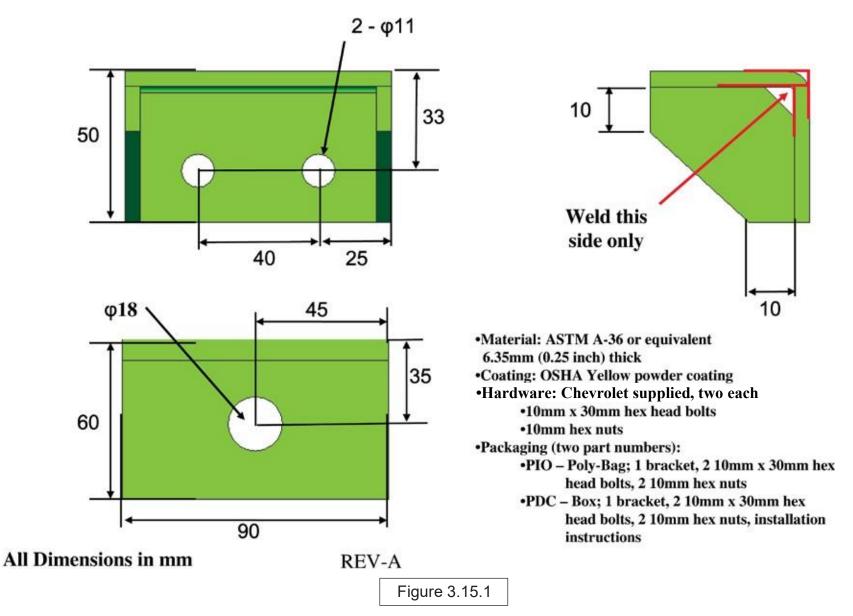

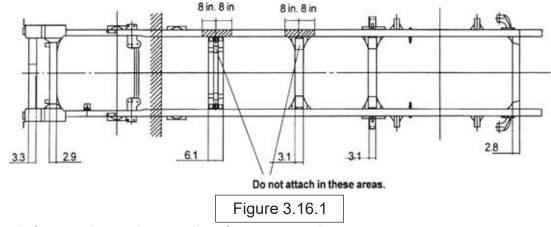

Figure 3.14.1

WHEELBASE	UBolt Crush Block Locations (in)

236.0	32.8	82.7	39.6	82.3	130.5
248.0	32.8	82.7	39.6	94.3	142.5

Body Mounting Bracket Specifications

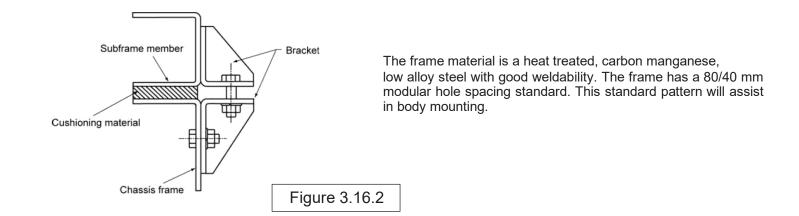

Subframe Mounting

Within 8 inches of bends in the chassis frame or the attachment points of any crossmembers.

Bracket Installation

Mounting brackets should be clamped to the chassis frame using bolts. For proper positions in which to install the bolts, refer to the preceding section and the section "Modifications to the Chassis Frame." In addition to the illustrated bracket and U -bolts a shear plate may be required for adequately body mounting. The body company will be responsible for engineering their own mounting system.

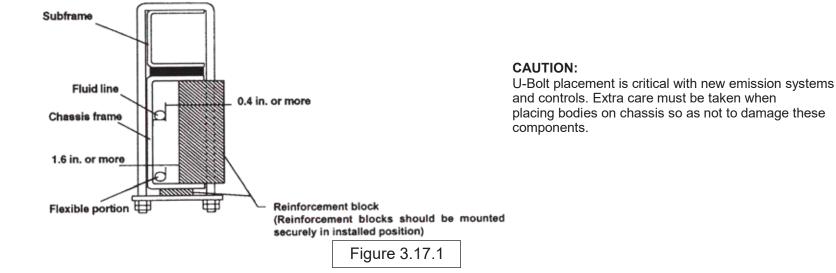

U-bolt Installation

When U-bolts are used to retain the subframe, reinforcement blocks must be installed in the frame members. This will prevent distortion of the frame flange as they are tightened. The drawing indicates the correct placement of reinforcement blocks. If you use wood blocks, be sure that there is sufficient clearance between them and any parts of the exhaust system. The use of J-bolts to retain the subframe is strictly prohibited.

If any fluid lines or electric cables are located near the reinforcement blocks, you must provide at least 0.4 inches of clearance between rigid or stationary portions, and at least 1.6 inches between moveable or flexible portions of the lines.

For the installation positions of the U-bolts, refer to "Prohibited Attachment Areas."

Modification of the Frame

Modifications of the chassis frame should be held to an absolute minimum. Modification work should be performed according to the instructions in the following paragraphs.

When modification is complete, chassis frame members should be carefully inspected to eliminate the possibility of any safety-related defects.

NOTE: PLEASE REFER TO NOTES ON CHASSIS FRAME MODIFICATION WITH ANTILOCK BRAKES.

Working on Chassis frame

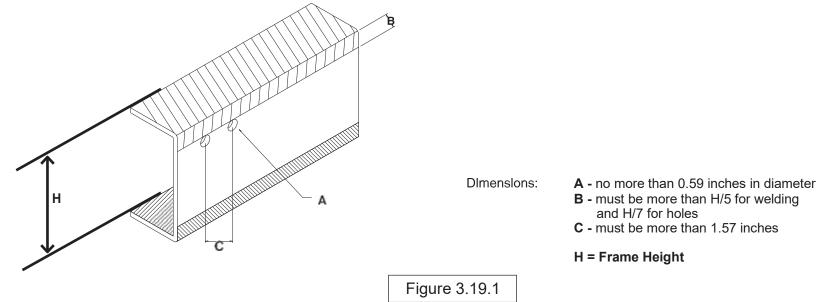

The chassis frame is designed and built with consideration for proper load distribution. Sufficient physical strength is provided when the load is evenly distributed. Installation of special equipment on the chassis frame can cause variations in load distribution. If even distribution of load is not kept in mind when the equipment is installed, localization of stresses on specific areas of the frame could cause cracking of the chassis frame members or other problems, even if the total weight of the equipment is within the design limit.

The chassis frame is designed as an integral unit. Therefore, we do not recommend cutting the chassis frame under any circumstances.

Drilling and Welding

IMPORTANT NOTE: For vehicles equipped with electronic engines and or electronic or hydra-matic transmissions, electric arc welding must be done with the negative battery cable disconnected.

- 1. Do not drill or weld in the shaded portions of the chassis frame members. Do not weld within 0.8 inches from the edges of any existing holes. (Ref. page 2.20)
- 2. Hold the length of any welding beads within 1.2-2.0 inches. Allow at least 1.6 inches between adjacent welding beads.
- 3. All holes must be drilled. Do not use a torch to make any holes.
- 4. All riveting must be done with cold rivets. Do not use hot rive ts.
- 5. The flange of the chassis frame must not be cut under any circumstances.
- 6. The subframe must be attached to the chassis frame with bolts. Do not weld.
- 7. Repaint exposed metal after drilling.

Reinforcement of Chassis Frame

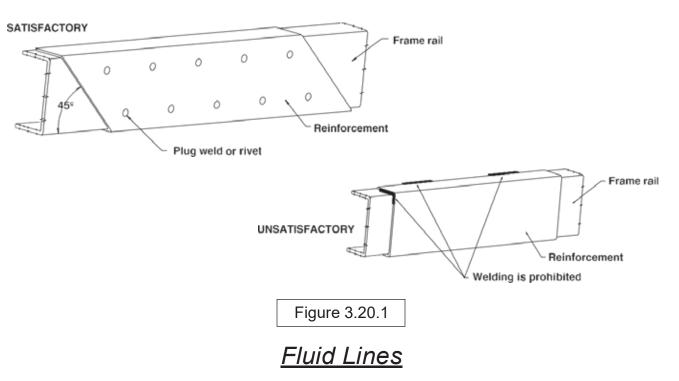

Reinforcements must be installed to prevent the considerable variation in the section modulus. They must be welded so as to avoid localized stresses.

The frame of the 6500XD is made of SAPH440 mild steel.

The drawing on the following page illustrates correct and incorrect methods of frame reinforcement.

Welding

- 1. Keep reinforcement plates and chassis frame free from moisture and water.
- 2. Avoid cooling with water after welding.
- 3. Use a suitable means to protect pipes, wires, rubber parts, leaf springs, etc. against heat and effect of sputtering.
- 4. Remove fuel tank assembly when welding portions near the fuel tank.
- 5. Remove coat of paint completely when welding painted areas. Repaint exposed metal after welding.

Do not disturb the layout of any brake lines or fuel lines unless absolutely necessary. When modification is needed, follow the instructions below carefully to ensure safety. Brake fluid lines must not be cut and spliced under any circumstances. We do not recommend the cutting or splicing of any fuel lines, but if it is absolutely necessary, be sure that the correct fitting and tools are used to form the joint, and then pressure test the joint. Steel lines are metric sizes.

Preparation of Additional Lines

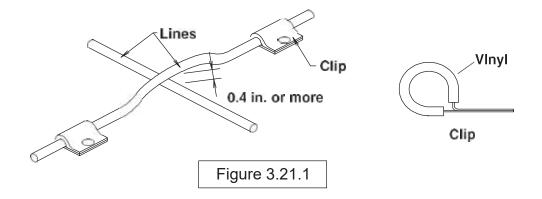

- 1. Where possible, use only genuine Chevrolet lines as supplied by authorized Chevrolet dealers.
- 2. Use the correct metric flaring and bending tools to form the lines.
- 3. Avoid repeated bending. Do not use heat for flaring and bending the lines. Before and after forming the new lines, examine them carefully for scratches, distortion, dents and the presence of any foreign matter.

Installation of Additional Lines

Install new lines away from adjacent parts and away from any sources of heat.

- 1. A minimum clearance of 0.4 inches must be maintained between lines. Where necessary, clip the lines into position in order to maintain this minimum clearance.
- 2. Minimize any crossing between lines. If a crossing is unavoidable, use the following procedure:
- a. At least 0.4 inches of clearance should be maintained between lines at the crossing point.
- b. If the 0.4 inches of clearance cannot be maintained, or if the lines are subject to vibration, clip them securely.
- 3. Plan the bends and clipping points of the lines to minimize vibration and the resulting fatigue.
- 4. Use rust-proofed clips and apply vinyl coating to the portions of the lines to be clipped.
- 5. Install new lines in positions where they are protected against water, dirt, grit, sand, rocks and other foreign matter that can come from above or below, or can be flung up by the wheels.

Electrical Wiring and Harnessing

To increase the reliability of the wiring, all frame harnesses are covered with corrugated vinyl tubing. The following instructions apply to extending or modifying these harnesses. See the Electrical Section for information on commonly used circuits in the Chevrolet LCF trucks.

Wiring

- 1. Most wiring connections on LCF vehicles are made with terminals. We recommend the use of terminals when splicing cables and wires.
- 2. When splicing, use new wire of the same gauge, and do not make splices inside the corrugated tubing.
- 3. When making connections to the end of the harness, make sure the connections are electrically perfect. Use insulating tape as needed to prevent the entry of water, which results in short circuits and/or corrosion.
- 4. When making new circuits, or modifying circuits already installed, make the cables only just taut enough to remove any slack. Use clips or grommets where required to protect cables from heat or sharp edges. When cables must run near the exhaust system, see the instructions in the "ExhaustSystem" section.

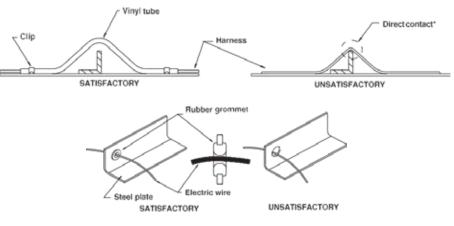

5. Always use rustproof clips, and apply vinyl coating to that portion of the clips in direct contact with the harnesses. No scotch clips or connectors.

6. To minimize the vibration of the harness, clipping points should be set up according to the table.

Harness Diameter	Clip Distance
less than 0.2 in.	less than 11.8 in.
0.2 in. ~ 0.4 in.	approx. 15.7 in.
0.4 in. ~ 0.8 in.	approx. 19.7 in.

Figure 3.22.1

- 7. When changing the length of the battery cable, do not cut or splice the existing cable. Make up a new cable of the correct length and wire gauge for the load and distance, without splices.
- 8. When using connectors, use a socket (female) connector on the electrical source side and a plug (male) connector on the electrical load side to lower the possibility of a short circuit when disconnected.
- 9. When connecting cables to moving or vibrating parts such as the engine or transmission, be sure to maintain sufficient slack in the wiring to absorb the vibration. Follow the example of existing cables connected by Chevrolet LCF. Keep flexible cables clear of other parts.
- 10. Do not use vinyl tape in the engine compartment. The heat will tend to make it peel off. Use plated steel clips coated with rubber or vinyl.
- 11. When locating auxiliary equipment or lines near the ECM caution should be used in order to protect the ECM from excessive vibration, heat or chemical reactions.

* Cables should not be in contact with sharp edges or pierced holes.

* Harnesses should not be installed on inside lower face of the chassis frame.

* Hamesses should not be taped to fuel lines or other lines. A sufficient clearance should be maintained between hamess and pipe lines.

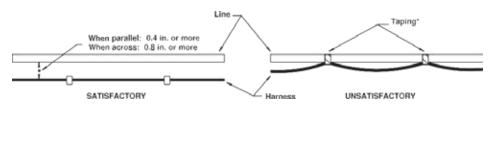

Figure 3.23.1

3.23

Wire Color Code

The electrical circuits of the 6500XD Chassis Cab are connected with low-voltage stranded wire for automotive applications. The color coding standards are as follows for the 6500XD Chassis Cab:

- (1) Black
- (2) White
- (3) Red (4) Green
- W Generator (alternator) circuit R Lighting circuit

B Starter circuits and grounds

G Signal circuit

- (5) Yellow
- (6) Brown
- (7) Light Green(8) Blue

- Y Instrument circuit
- Br Accessory circuit
- Lg Other circuit
- L Windshield wiper motor circuit

Maximum Allowable Current

Harness Design Diameter (mm)	AWG Equivalent	No. of Wires/Wire Diameter (mm)	Cross Sectional Area (mm2)	Maximum Allowable Current(Amps)
100	00	217/0.80	109.1	363
85	0	169/0.80	84.96	305
60	1	127/0.80	63.84	248
50	1	108/0.80	54.29	223
40	1	85/0.80	42.73	191
30	2	70/0.80	35.19	171
20	4	41/0.80	20.61	123
15	6	84/0.45	13.36	93
8	8	50/0.45	7.952	68
5	8	65/0.32	5.228	51

0.85	18	11/0.32	0.8846	17
0.5	20	7/0.32	0.5629	13

Reference: The values given in the "maximum allowable current" column are based on the ambient temperature condition of 104°F with temperature increase of 104°F.

Figure 3.24.1

Electrical System Modifications

Modifications/add-on wiring must be carefully reviewed to ensure compatibility with the base vehicle wiring by reviewing system schematics, wire routing paths, harness connections, etc. Due to the wide range of modifications that may be required for vocational needs, it is not feasible for the O.E.M. to take into account all potential revisions. For this reason, any person modifying existing vehicle wiring must assume responsibility that the revisions have not degraded the electrical system performance. Any add-on wiring needs to be properly fused and routed to prevent cut, pinch, and chafe problems, as well as avoid exposure to excessive heat. Care must be exercised that existing vehicle interfaces do not have their current load capabilities exceeded, and that the respective control devices are not overloaded. Added wire size should be at least as large as the wire to which it is attaching in order for fuse protection to be maintained

A Packard electric wiring repair kit is available through Kent-Moore (P/N J38125-B) (Phone # 1-800-345-2233). This kit contains instructions, tools and components for making repairs to wiring harness components. This kit would also greatly assist in accomplishing necessary add-on wiring such as body marker lamps, so that system reliability/durability is maintained.

Electrical wiring components can be obtained through your authorized Chevrolet dealers. Packard Electric components are also available through Power and Signal (www.powerandsignal.com). Power and Signal may also be able to assist in making necessary wiring additions by providing custom wiring stubs or jumpers to your specifications.

Caution: Before servicing any electrical component, the ignition key must be in the LOCK position and all electrical loads must be OFF, unless instructed otherwise in Chevrolet service procedures. If a tool or equipment could easily come in contact with a live exposed electrical terminal, also disconnect the negative battery cable. Do not disconnect cable within 3 minutes after turning the ignition key to the Lock position. Failure to follow these precautions may cause personal injury and/or damage to the vehicle or its components.

Exhaust System

Modification of the exhaust system should be avoided. If modifications are absolutely necessary, the following points should be maintained.

1. Maintain the clearance specified in the "Exhaust System" table between all parts of the exhaust system and any fuel lines, brake lines, brake hoses, electrical cables, etc. The exhaust outlet should not point toward any of these parts.

	Clearance
Brake lines	2.4 in. or more. (If the combined section of a group of parallel brake lines is more than 7.8 in., a clearance of 7 in. or more should be provided.)
Flexible brake hoses	7.8 in. or more. (The temperature of flexible brake hoses should not exceed 158°F. If the highest temperature is not measurable, a clearance of more than 15.7 in. should be maintained between the hoses and the exhaust system.)
Wiring harnesses and cables	7.8 in. or more. (The temperature of flexible brake hoses should not exceed 158°F. If the highest temperature is not measurable, a clearance of more than 15.7 in. should be maintained between the hoses and the exhaust system.)
Steel fuel lines	3.1 in. or more.
Rubber or vinyl fuel hoses	5.9 in. or more.

Figure 3.25.1

- 2. If a tool box is installed, it should preferably be made from steel. If a wooden tool box is installed, at least 7.8 inches of clearance should be maintained between the tool box and any parts of the exhaust system.
- 3. If the exhaust system is modified, it is the responsibility of those making the modification to ensure that the noise level meets appropriate standards.
- 4. If the exhaust system is modified it is the responsibility of those making the modification to ensure that the emission levels meet appropriate standards.

Fuel System

Relocation of the fuel tank, or installation of additional fuel tanks, is not recommended. If modifications to the fuel system are unavoidable, follow these recommendations:

1. Maintain adequate clearance between the fuel tank and any other device or structure.

2. Do not connect any additional fuel hose.

Rear Lighting

Brackets installed are temporary. Please do not use these brackets for body installation.

Serviceability

No matter what other modifications or changes are made, access to components requiring daily preventive maintenance or other routine service must not be obstructed. This includes:

- 1. Inspection, filling and draining of engine oil and cooling water.
- 2. Inspection, filling and draining of transmission fluid.
- 3. Adjustment, removal and installation of the fan belts.
- 4. Inspection, filling and removal of the battery and battery cover.
- 5. Maintenance of clearance for tightening of check bolt on brake safety cylinder.
- 6. Operation of the spare tire carrier, including mounting and dismounting of the spare tire.

Wheelbase Alteration

With certain applications, it may become necessary to alter the wheelbase of the chassis. The next two sections provide the suggested guidelines for accomplishing either shortening or lengthening of the wheelbase.

Shortening/Lengthening the Wheelbase Without Altering the Frame

Since the frame is an integral part of the chassis, it is recommended that the frame not be cut if it is possible to avoid it. When shortening/lengthening the wheelbase on some models, it is possible to do so without cutting the frame. This is possible on models which have a straight frame rail. If the chassis does not have a straight frame rail, it may still be necessary to cut the frame. For instructions on shortening/lengthening these chassis, refer to the "Altering the Wheelbase by Altering the Frame" section of this book. Otherwise, the wheelbase may be shortened/lengthened by removing the rear suspension, drilling new suspension mounting holes at the appropriate spot in the frame, and sliding the rear suspension, suspension liner, and suspension crossmembers forward or aft.

The suspension and suspension crossmembers' rivet holes left in the frame rail flange must be filled with GRADE 8 bolts and hardened steel washers at both the bolt head and nut, HUC bolts or GRADE 8 flanged bolts and hardened steel washers at the nut. When shortening/lengthening the wheelbase in this manner, the following guidelines must be adhered to:

- 1. All frame drilling must comply with the DRILLING AND WELDING section of this book.
- 2. All rivet holes left in the frame rail flange from the suspension and suspension crossmembers must be either filled with GRADE 8 bolts and hardened steel washers at both the bolt head and nut, HUC bolts or GRADE 8 flanged bolts and hardened steel washers at the nut.
- 3. The components required to be slid forward or aft are the suspension and suspension hangers, suspension crossmembers and suspension frame liner.

Altering the Wheelbase by Altering the Frame

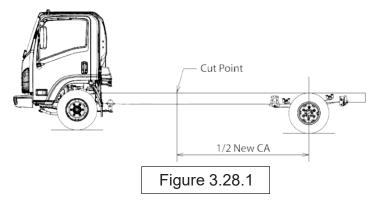

Even on a straight frame rail, it may be desirable to cut the frame and lengthen or shorten the wheelbase rather than simply sliding the rear suspension back or forward. The following section offers some guidelines and suggestions for cutting and lengthening or shortening the frame.

Glossary of Terms – Chassis Wheelbase Alteration

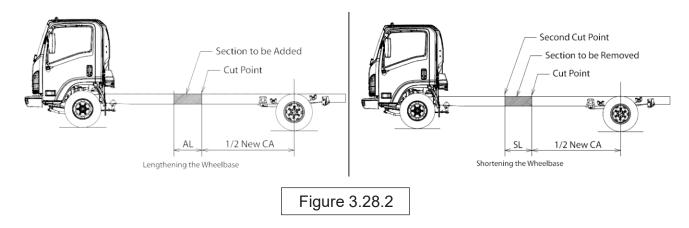

- CA Length from back-of-cab to rear axle centerline in inches.
- AL Added length (in case of a lengthened wheelbase). Difference between WB (new) and WB (old).
- SL Shortened length (in case of shortened wheelbase). Difference between WB (old) and WB (new).

- 1. Determine the added length (AL) or shortened length (SL) required to lengthen or shorten chassis. (For added wheelbase: New CA = CA + AL; For shortened wheelbase: New CA = CA SL.)
- 2. Obtain the material to be used as the insert for the lengthened wheelbase in the correct length (AL). The insert must have the same cross sectional dimensions and yield strength as the original frame rail.
- 3. Divide the new CA by two (2). Measure (new CA)/2 from the center of the rear axle forward and mark this point on the chassis frame (see figure below).

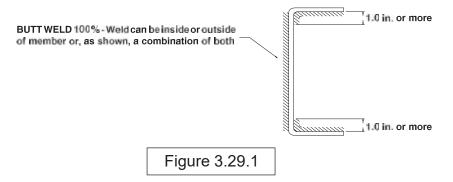

4. Cut the chassis frame at this point. If the wheelbase is to be lengthened, addition of the previously obtained insert (of length AL determined in step 1) will be made at this time. If the wheelbase is to be shortened, measure the distance (SL) forward of this cut and remove a length (SL) section from the chassis frame (see figure below). Insure that an adequate area on the frame remains for the required addition of the necessary reinforcements. These are the only suggested places for cutting the frame and reinforcements.

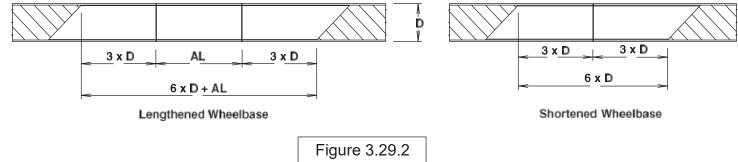

5. When welding the insert (length AL for wheelbase lengthening) to the original frame rail, a continuous butt weld must be used at the splices. When shortening the wheelbase, weld the ends of the chassis frame together with a continuous butt weld over the junction of the frame ends. Weld can be both the inside and outside of the frame rails using welding techniques prescribed by established welding standards (ref. SAE J1147) and in accordance with this guide. An example of this weld is shown below.

6. Determine the appropriate additional internal reinforcements which are required using this equation:

Reinforcement Length = AL + 6 x (original frame rail web depth).

The figure below shows how this reinforcement is to be placed over the extended or shortened section of the frame rail.

D = Original frame rail web depth

The suggested cross section of this reinforcement is a snug fit inner channel. If the new wheelbase exceeds the upper limit of the optional wheelbases of this model, i.e.; a "long bridge", it may be necessary to use an "inverted L" reinforcement in addition to the snug fit channel reinforcement (see figures on next page). Application Engineering should be consulted for approval of such cases. It should be noted that these methods of reinforcements, and any other methods which may be used, require a 45° angled cut at both ends to avoid stress concentrations in the frame (note the figures under item 7).

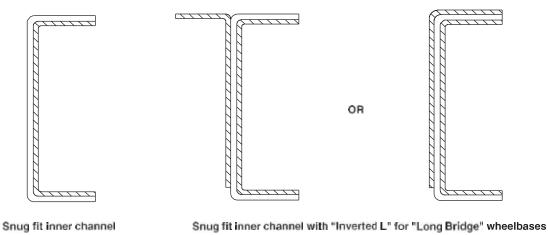

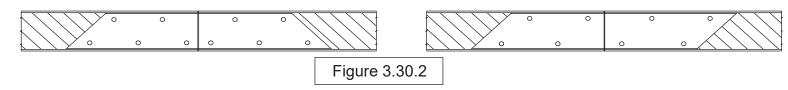

Figure 3.30.1
 7. The reinforcements must be fastened securely to only the web of the original chassis frame rail. The reinforcement must be held rigidly in place using either HUC bolts, GRADE 8 bolts and hardened steel washers at both the bolt head and nut, or GRADE 8 flanged bolts and hardened steel washers at the nut. Below are some suggested bolt patterns. It should be noted that these bolt patterns must not align the bolts vertically, i.e.: the bolt pattern must be staggered.

- 8. Lengthening the frame will also require extending the brake lines, basic chassis electrical harness. It is recommended that the original brake lines be removed and replaced with brake lines of the same diameter as the original lines and of the appropriate length. The extended ABS brake lines must be supported back to the frame to prevent vibration. The electrical harness must be extended in accordance with the ELECTRICAL WIRING AND HARNESSING section of this book.
- 9. The propeller shafts' overall length will also need to be lengthened or shortened. If the extension is within the limits of the optional wheelbases of the respective model, the exact propeller shaft lengths and angles are given on or about Page 12 of the respective sections of this book. If the modified wheelbase exceeds the optional wheelbases of the respective model, the following guidelines must be adhered to:

a. Propeller Shaft Length

The maximum propeller shaft lengths (pin to pin) for the respective models are shown in the table below.

ENGINE	DIESEL
Model	6500XD
Propeller Shaft Diameter (in.)	4.0
Maximum Propeller Shaft Length (in.)	67.9

Figure 3.31.1

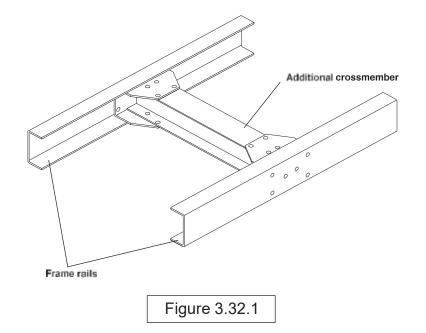

b. Propeller Shaft Angles

The maximum propeller shaft angles, with respect to the previous shaft, are shown in the table below.

ENGINE	DIESEL
Model	6500XD
Maximum Propeller Shaft Angle	3.4°

Figure3.31.2

- c. The propeller shaft angles must be designed such that the angles will cancel to avoid propeller shaft whip.
- d. The propeller shaft yokes must be assembled such that the propeller shaft yokes are "in phase."
- 10. Extending the frame will also require relocation and/or addition of crossmembers. If the extension is within the limits of the optional wheelbases of the respective model, the exact crossmember locations and dimensions are given in the respective model sections of this book. If the modified wheelbase exceeds the optional wheelbases of the respective model, the following guidelines must be adhered to:
 - a. The crossmember location will largely be determined by the propeller shaft lengths and where the center carrier bearing locations are for the propeller shaft assembly.
 - b. A crossmember must be located at the front and rear spring hangers of the rear suspension (refer to the appropriate section of this book to see where these suspension crossmembers are to be located).
 - c. The crossmember must be constructed such that it supports both the upper and lower flange on each frame rail (see drawing on next page). A crossmember such as the one on the next page may be constructed, or LCF crossmembers may be obtained from your Chevrolet parts dealer.

d. The maximum distance between crossmembers for the respective models is given in the table below.

ENGINE	DIESEL
Model	6500XD
Maximum Distance Between Crossmemebers (in.)	35.7
Figure 3.32.2	

- e. The drilling for any additional holes in the frame rails must comply with the DRILLING AND WELDING section of this book.
- 11. All other aspects of lengthening or shortening the wheelbase must comply with the applicable section of this Body Builder's Guide.
- 12. Please contact applications engineering for guidelines on 6500XD CHASSIS frame modifications when the vehicle is equipped with an Antilock Brake System.

Notes:

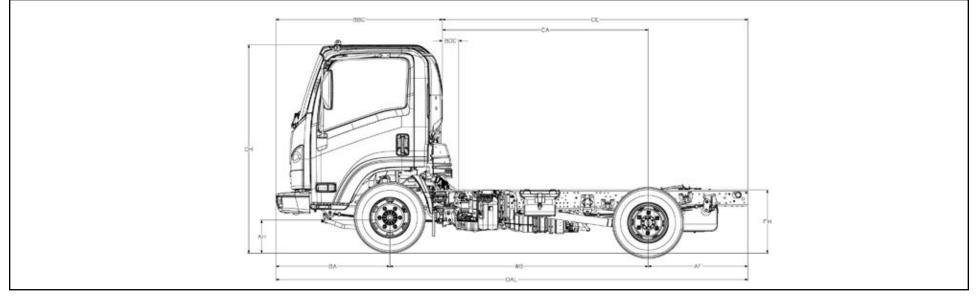

- Indicated body size and chassis wheelbase combination requires the installation of a liftgate for an acceptable weight distribution.
- [2] WARNING Body selection recommendations are based on water level weight distribution and no accessories (i.e.liftgates or refrigeration units). This table is intended for reference and does not preclude the necessity for an accurate weight distribution calculation.

2024 Chevrolet LCF

[3] The BOC (back of cab) values shown are the minimum requirements for the chassis. A weight distribution analysis should be performed for the completed vehicle to determine the necessary BOC value. Revision: 05/31/23

Low Cab Forward Towing Procedure

WHEN TOWING A VEHICLE: Proper equipment must be used to prevent damage to vehicles during any towing. State and local laws which apply to vehicles in tow must be followed. Vehicles should not be towed at speeds in excess of 55 MPH (88 km/h). Connect to the main structural parts of the vehicle. Do not attach to bumpers, tow hooks or brackets. Use only equipment designed for this purpose. Follow the instructions of the wrecker manufacturer. A safety chain system must be used. The procedures below must be followed when towing to prevent possible damage.

FRONT END TOWING (FRONT WHEELS OFF GROUND)

To prepare a disabled vehicle for front end towing with front wheels raised off the ground, the following steps are necessary:

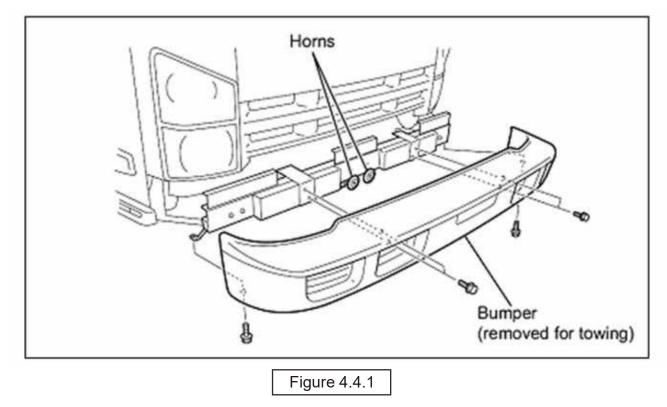

- Block the rear wheels of the disabled vehicle.
- Disconnect the propeller shaft at the rear axle. Secure the propeller shaft to the frame or cross member.

CAUTION: WHEN TOWING, DISCONNECT THE DRIVESHAFT AT THE REAR AXLE TO ENSURE THE TRANSMISSION IS NOT DAMAGED.

If there is damage or suspected damage to the rear axle, remove the axle shafts.

Cover the hub openings to prevent the loss of lubricant or entry of dirt or foreign objects. Place a 10 cm (4 in) wood beam against the towing guide behind the bumper.

(If no 10 cm (4 in) is available, then remove the bumper.) Ensure towing chains do not come into contact with the horns or the bumper.

AFTER TOWING

After towing the vehicle, block the rear wheels and install axle shafts or driveshaft. Apply the parking brake before disconnecting from the towing vehicle.

FRONT END TOWING (ALL WHEELS ON THE GROUND)

Your vehicle may be towed on all wheels provided the steering is operable. Remember that power steering and brakes will not have power assist. There must be a tow bar installed between the tow vehicle and the disabled vehicle.

TOWING WITH ALL WHEELS ON THE GROUND

To prepare a disabled vehicle for front end towing with all wheels on the ground, the following steps are necessary:

- Block the wheels of the disabled vehicle.
- Disconnect the propeller shaft at the rear axle. Secure the propeller shaft to the frame or crossmember.

CAUTION:

When towing, disconnect the driveshaft at the rear axle to ensure the transmission is not damaged. Provide wood blocking to prevent towing chains and bar from coming into contact with the bumper. If there is damage or suspected damage to the rear axle, remove the axle shafts. Cover the hub openings to prevent the loss of lubricant or entry of dirt or foreign objects.

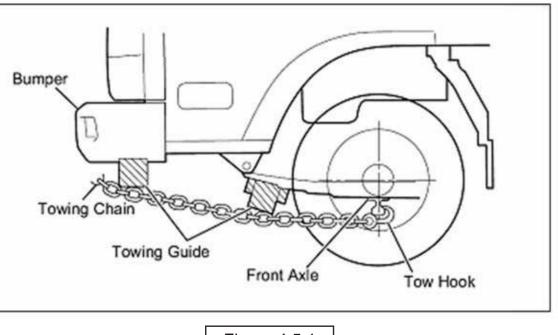

Figure 4.5.1

CAUTION:

When towing, disconnect the driveshaft at the rear axle to ensure the transmission is not damaged. Provide wood blocking to prevent towing chains and bar from coming into contact with the bumper. If there is damage or suspected damage to the rear axle, remove the axle shafts. Cover the hub openings to prevent the loss of lubricant or entry of dirt or foreign objects.

AFTER TOWING

After towing the vehicle, block the rear wheels and install axle shafts or propeller shaft. Apply the parking brake before disconnecting from the towing vehicle. Check and fill rear axle with oil, if required.

REAR END TOWING

When towing a vehicle with rear wheels raised, secure the steering wheel to maintain straight-ahead position. Make certain that the front axle is not loaded beyond the front axle gross axle weight rating (GAWR) as indicated on the vehicle's VIN and weight rating plate.

SPECIAL TOWING INSTRUCTIONS

- 1. All state and local laws regarding such items as warning signals, night illumination, speed, etc., must be followed.
- 2. Safety chains must be used.
- 3. No vehicle should ever be towed over 55 MPH (88 km/h).
- 4. Loose or protruding parts of damaged vehicles should be secured prior to moving.
- 5. A safety chain system completely independent of the primary lifting and towing attachment must be used.
- 6. Operators should refrain from going under a vehicle which is being lifted by the towing equipment unless the vehicle is adequately supported by safety stands.
- 7. No towing operation which for any reason jeopardizes the safety of the wrecker operator or any bystanders or other motorists should be attempted.

5.01

6500XD Towing Procedure

When towing a vehicle: To move a disabled vehicle, it is best to rely on someone in the wrecker or tow truck business. If that is not possible, follow these procedures. When towing, use appropriate equipment and comply with state and local legal requirements. Do not try to start the engine by towing or pushing the vehicle.

CAUTION:

- Be sure to chock the wheels when disconnecting the axle shaft. The vehicle could start to move and cause a serious accident. The vehicle will start moving upon disconnecting the axle shaft.
- Place the gearshift lever in the "N" position, and tow for a maximum distance of 6.2 miles (10 km) at speeds less than 25 MPH (40 km/h). Other than the above, disconnect the axle shaft when towing to avoid damage to the transmission.
- Whenever possible, tow a vehicle with the engine started. If the engine is not started:
- The brakes will not be as effective
- The steering wheel will be hard to turn
- The steering wheel could lock, making it impossible to move. This is extremely dangerous. (When the ignition key is removed.)
- If you apply any one of the air brake parking controls while the vehicle is moving, your rig will stop suddenly. If you are not ready for this, you or others could be injured. Do not apply any one of these controls while you are driving, unless you have to make an emergency stop.

Front End Towing (All wheels on the ground, or the front wheels are off the ground): When it is possible to operate the steering wheel, the vehicle can be towed with all wheels on the ground. If the engine cannot be started, the power steering system does not work, making steering difficult. In addition, when air pressure is low, the brakes will not work. Either install a tow bar between the towing vehicle and the disabled vehicle, or use a tow truck to move the disabled vehicle. To prevent damage to the differential and pinion seal, the axle shafts need to be removed whenever the vehicle is towed with the rear tires on the ground. Remove the axle shaft and plug up the opening of the hub to prevent differential gear oil from leaking, or to prevent dirt or foreign objects from entering the axle. When towing, disconnect the axle shaft at the rear axle to ensure the transmission is not damaged.

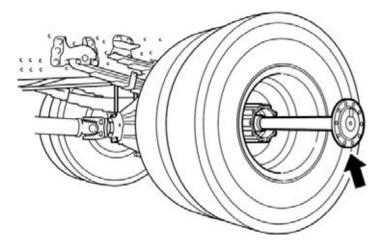

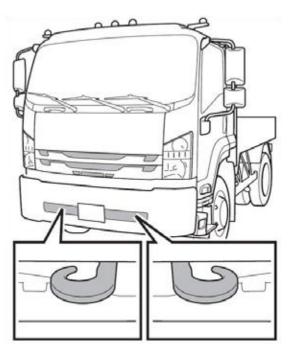

Figure 5.02.1

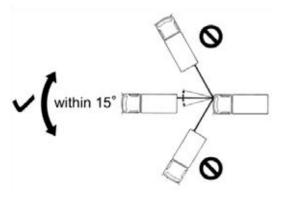

1. If the vehicle is towing or is towed, firmly attach a rope to the front towing hook on the same side.

2. During towing, carefully watch the stop lights of the towing vehicle in order to prevent slack in the rope. Ensure that there are no strong shocks or lateral force applied to the vehicle. Excessive towing load can damage the towing hook.

CAUTION:

- Do not tow a vehicle at an angle of greater than 15°. This could exert too much stress on the vehicle and damage it.
- Attach a rope to the towing hook only. Attaching a rope to any other part of the vehicle could damage it.
- Make sure there are no people near the towing rope and hook before towing a vehicle. If the rope snaps, people nearby could be injured.
- The towing hook is for use to tow a vehicle with about the same weight as the towing vehicle on good roads.
- When coming to channels or muddy areas, unload the vehicle. Do not use the towing hook to tow, but tow with a rope attached to the axle.

AGE 5.1

EIGHT DISTRIBUTION CONCEPTS

Weight Restrictions

The Gross Vehicle Weight Rating (GVWR) and the Gross Axle Weight Rating (GAWR) of each Incomplete Vehicle are specified on the cover of its Incomplete Vehicle Document in conformance to the requirements of Part 568.4 of the Federal Motor Vehicle Safety Regulations. The final stage manufacturer is responsible under Part 567.5 to place the GVWR and the GAWR of each axle on the Final Vehicle Certification Label. The regulation states that the appropriate rating "shall not be less than the sum of the unloaded vehicle weight, rated cargo load, and 150 pounds times the vehicle's designated seating capacity."

Unloaded vehicle weight means the weight of a vehicle with maximum capacity of all fluids necessary for operation of the vehicle, but without cargo or occupants.

During completion of this vehicle, GVWR and GAWR may be affected in various ways, including but not limited to the following:

- 1. The installation of a body or equipment that exceeds the rated capacities of this Incomplete Vehicle.
- 2. The addition of designated seating positions which exceeds the rated capacities of this Incomplete Vehicle.

3. Alterations or substitution of any components such as axles, springs, tires, wheels, frame, steering and brake systems that may affect the rated capacities of this Incomplete Vehicle.

Use the following chart to assure compliance with the regulations. Chassis curb weight and GVW rating is located on Page 2 in each vehicle section. Always verify the results by weighing the completed vehicle on a certified scale.

Curb Weight of Chassis (lbs.)		(From required vehicle section)
PLUS weight of added body components, accessories or other permanently attached components.	+	(Body, liftgate, reefer, etc.)
PLUS total weight of passengers, air conditioning and all load or cargo.	+	(Driver, passengers, accessories and load)
EQUALS Gross Vehicle Weight (lbs.) (GVW) of completed vehicle.	=	(Should equal GVWR from required vehicle section)

Figure 5.1.1

Gross Axle Weight Rating

The Gross Vehicle Weight is further restricted by the Gross Axle Weight Rating (GAWR). The maximum GAWR for both front and rear axles is listed in each Vehicle Section. Weight distribution calculations must be performed to ensure GAWR is not exceeded. Always verify the results by weighing the completed vehicle on a certified scale.

NOTE: Although the Front Gross Axle Weight Rating (FGAWR) plus the Rear Gross Axle Weight Rating (RGAWR) may exceed the Gross Vehicle Weight Rating (GVWR), the total GVW may not exceed the respective maximum GVWR.

The variation in the GAWRs allow the second stage manufacturer some flexibility in the design of the weight distribution of the attached unit.

Weighing the Vehicle

Front and rear GAWRs and total GVWR should be verified by weighing a completed loaded vehicle. Weigh the front and rear of the vehicle separately and combine the weights for the total GVWR. All three weights must be less than the respective maximum shown in the vehicle sections.

Tire Inflation

Tire inflation must be compatible with GAWR and GVWR as specified on the cover of the Incomplete Vehicle Document for each vehicle.

<u>Center of Gravity</u>

The design of the truck body should be such that the center of gravity of the added load does not exceed the guidelines as listed in each Vehicle Section. If the body is mounted in such a way that the center of gravity height exceeds the maximum height of the center of gravity designated for each model, the directional stability at braking and roll stability at cornering will be adversely affected. A vertical and/or horizontal center of gravity calculation must be performed if a question in stability arises to ensure the designed maximum height of the center of gravity is not violated.

Weight Distribution

A truck as a commercial vehicle has but one purpose. That purpose is to haul some commodity from one place to another. A short distance or a long distance, the weight to be hauled, more than any other factor, determines the size of the truck. A small weight requires only a small truck; a large weight requires a large truck. A simple principle, but it can easily be misapplied. In any case, selecting the right size truck for the load to be hauled will ensure that the job will be done and that it will be able to be done with some degree of reliability and within the legal limitations of total gross weight and axle gross weights.

Not only must a truck be selected that will handle the total load, but the weight must also be properly distributed between the axles. This is of extreme importance from both a functional and economic aspect. If a truck consistently hauls less than its capacity, the owner is not realizing full return on his investment and his operating costs will be higher than they should be. If the truck is improperly loaded or overloaded, profits will be reduced due to increased maintenance costs and potential fines resulting from overloading beyond legal limitations. Careful consideration must be given to distribution of the load weight in order to determine how much of the total, including chassis, cab, body and payload, will be carried on the front axle and how much will be carried on the rear axle, on the trailer axles and the total. Moving a load a few inches forward or backward on the chassis can mean the difference between acceptable weight distribution for the truck or an application that will not do the job satisfactorily.

Every truck has a specific capacity and should be loaded so that the load distribution is kept within Gross Axle Weight Ratings (GAWR) and the truck's Gross Vehicle Weight Rating (GVWR) or Gross Combination Weight Rating (GCWR) for a tractor/trailer and the weight laws and regulations under which the truck will operate. Improper weight distribution will cause problems in many areas:

- 1. Excessive front end wear and failure
 - a. Tie-rod and kingpin wear
 - b. Front axle failure
 - c. Overloading of front suspension
 - d. Wheel bearing failure
- 2. Rapid tire wear
 - a. When the weight on a tire exceeds its rating capacity, accelerated wear will result and could result in tire failure.

Weight Distribution

3. Rough, erratic ride

- a. If the center of the payload is directly over or slightly behind the rear axle, the lack of sufficient weight on the front axle will create a bobbing effect, very rough ride, and erratic steering. This condition will be magnified when the truck is going uphill.
- 4. Hard steering
 - a. When loads beyond the capacity of the front axle are imposed upon it, the steering mechanism is also overloaded and hard steering will result.
 - b. Excessive overloading could result in steering component damage or failure.
- 5. Unsafe operating and conditions
 - a.Poor traction on the steering axle effects the safety of the driver and equipment, particularly on wet, icy and slippery surfaces. Experience indicates that approximately 30% of the total weight at the ground on a truck or tractor should be on the front axle with a low cab forward vehicle.
 - b.When a truck is overloaded, a dangerous situation may exist because minimum speeds cannot always be maintained, directional control may not be precise and insufficient braking capacity can cause longer than normal braking distances.
- 6. High maintenance costs
 - a. Improper weight distribution and overloading cause excessive wear and premature failure of parts. Additional stresses imposed on the frame by the misapplication of wheelbases may be instrumental in causing the frame to crack or break.
- 7. Noncompliance with weight laws and regulations
 - a. When there is the possibility that axle loads will exceed existing weight laws and regulations, careful weight distribution is necessary to provide a correct balance between front and rear axle loads and total load within legal limitations.

In this way, maximum payloads may be carried without exceeding legal limits. If the body is too long for a wheelbase, the center of the body and payload is placed directly over the rear axle. This places all the payload on the rear axles, resulting in overloading the rear tires, rear axle springs and wheel bearings and potentially exceeding the rear axle legal weight limit. The front axle is then carrying no part of the payload and is easily lifted off the ground when going over rough terrain, creating a very rough ride and temporary loss of steering control. If the body is too short for the wheelbase used, frame stress may be increased and may result in excessive loads on the front axle. Excessive front axle loads increase wear on the kingpins and bushings, wheel bearings and steering gear. Excessive front axle loads also overstress the front axle, springs, tires and wheels. All of these contribute directly to higher maintenance costs and hard steering, both of which are undesirable.

Weight Distribution

Weight distribution analysis involves the application of basic mathematical principles to determine the proper positioning of the payload and body weight in relation to the wheelbase of the truck chassis.

It is much less expensive to work all of this out on paper, make mistakes on paper and correct them there than to set up the truck incorrectly and either have it fail to do the job or, much worse, fail completely.

It is important to become familiar with the dimensions of the truck, as these will be needed to perform the necessary calculations.

2.	Distance C.G. must be placed behind the front axle	=	<u>(Weight transferred to the rear axle) x (Wheelbase)</u> (Total weight)
3.	Wheelbase	=	(Total weight) x (Distance C.G. is behind the front axle) (Weight to be transferred to the rear axle)
4.	Total Weight	=	(Weight to be transferred to the rear axle) x (Wheelbase) (Distance C.G. is behind the front axle)
9.	Remember	=	Total weight must always equal weight transferred to the rear axle plus the weight transferred to the front axle
			100 lb.
			Pivot

20"

To find the value of "P", the leverages must be equal for balance.

P lb.

Example:100 lbs. x 8 in. = "P" x 20 in.or"P" = $\frac{100 \text{ lbs. x 8 in.}}{20 \text{ in.}}$

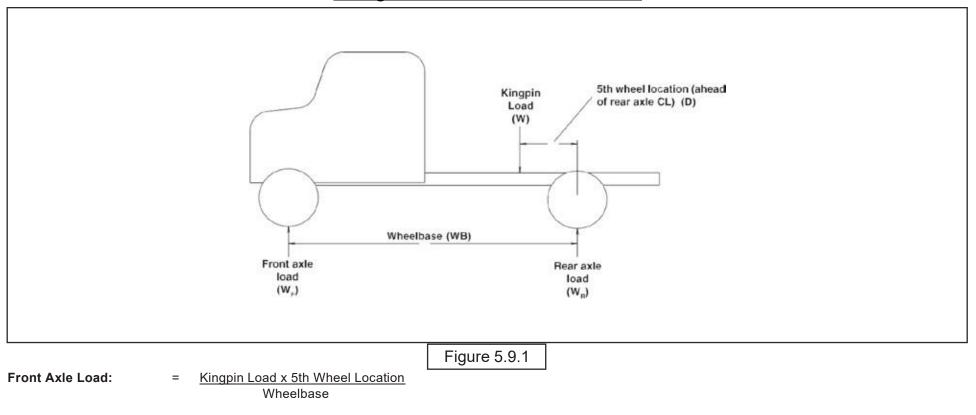

Therefore: "P" = 40 lbs.

This same approach is used to determine axle loadings on a tractor or truck chassis. Assuming the rear axle serves as a pivot point, the front axle load can be determined by applying the lever principle.

Figure 5.8.1

2024 Chevrolet LCF

Weight Distribution Formulas

Rear Axle Load: = Kingpin Load – Front Axle Load

Example: (4) A tractor has a wheelbase of 150 inches. If the kingpin load is 20,000 lbs. and the fifth wheel location is 15 inches, find the total weight on the front and rear axles. The tare weight of the tractor is 7,000 lbs. on the front axle and 4,400 lbs. on the rear axle.

Front Axle Load 20,000 x 15 150 WB = 2,000 lbs. Rear Axle Load = 2,000 + 7,000 lbs. = 9,000 lbs. Therefore: Total Front Axle Weight = 2,000 + 9,000 lbs. = 11,000 lbs. Total Rear Axle Weight = 4,400 + 18,000 lbs. = 22,400 lbs. 2024 Chevrolet LCF PAGE

5,9

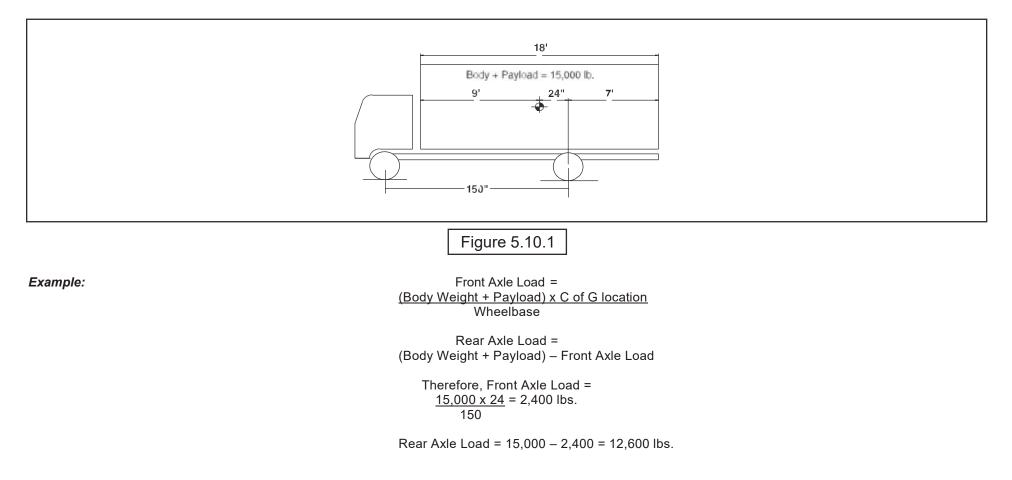

Weight Distribution Formulas

In calculating the weight distribution for a truck, the same lever principle is applied; however, there is one change in the initial consideration of the method of loading the truck body. Instead of the trailer kingpin location ahead of the rear axle centerline, we must determine the position of the center of gravity of the pay-load and body weight in relation to the rear axle centerline.

For our calculations, we assume that the payload is distributed in the truck body so that the load is supported evenly over the truck body floor (water-level distribution). The weight of the body itself is also considered to be evenly distributed along the truck frame. In this manner, we can add the payload and body weights together and calculate the distribution on the vehicle chassis as an evenly distributed load on the truck frame rails.

So that we can make the necessary calculation in a simple manner, the total body and payload weight is considered to act at the center of gravity which will be at the center of the body length.

Weight Distribution Formulas

If the truck tare weight without the body is 5,000 lbs. on the front axle and 2,400 lbs. on the rear axle, then

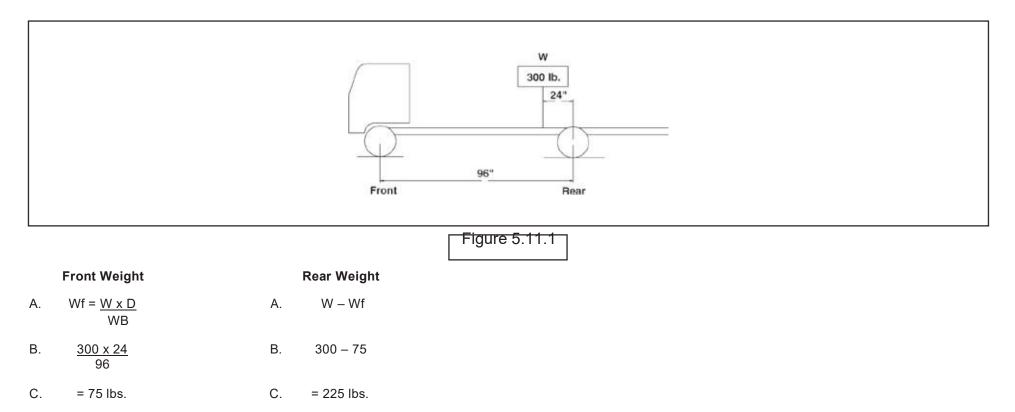

Total Front Axle Weight = 5,000 + 2,400 = 7,400 lbs. and

Total Rear Axle Weight = 2,400 + 12,600 = 15,000 lbs.

This same lever principle is applied in all calculations of weight distribution, whether we are dealing with concentrated loads as with a kingpin load acting on a fifth wheel or if it be with an evenly distributed load as with a truck body. The same approach is made in calculating an evenly distributed load on a trailer.

In the case of a tractor/trailer or a tractor with a set of double or triple trailers, each unit is handled as a separated unit and then combined to determine the total.

This simple example illustrates how the principles are applied. Using the formulas, find the weight distributed to each axle.

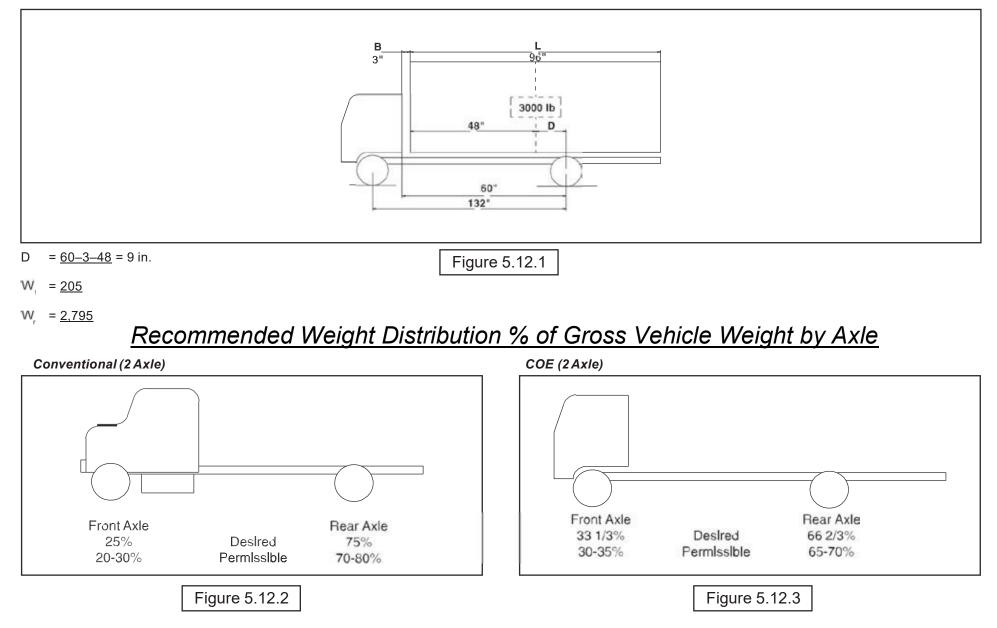

The body manufacturer can provide the body length and weight, or actual measurements of the body may be taken with a tape. Generally, (D) is unknown. This you must find logically, or with a tape measure.

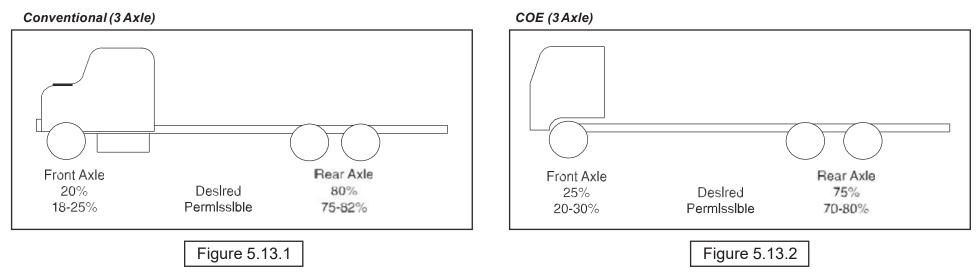

Weight Distribution Formulas

Find (D) and then solve for Wf and Wr.

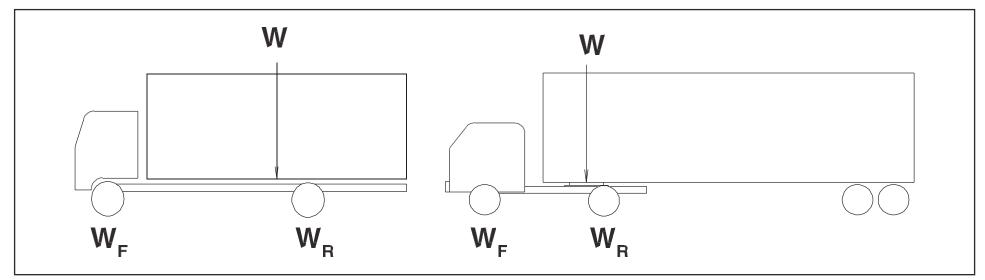

Recommended Weight Distribution % of Gross Vehicle Weight by Axle

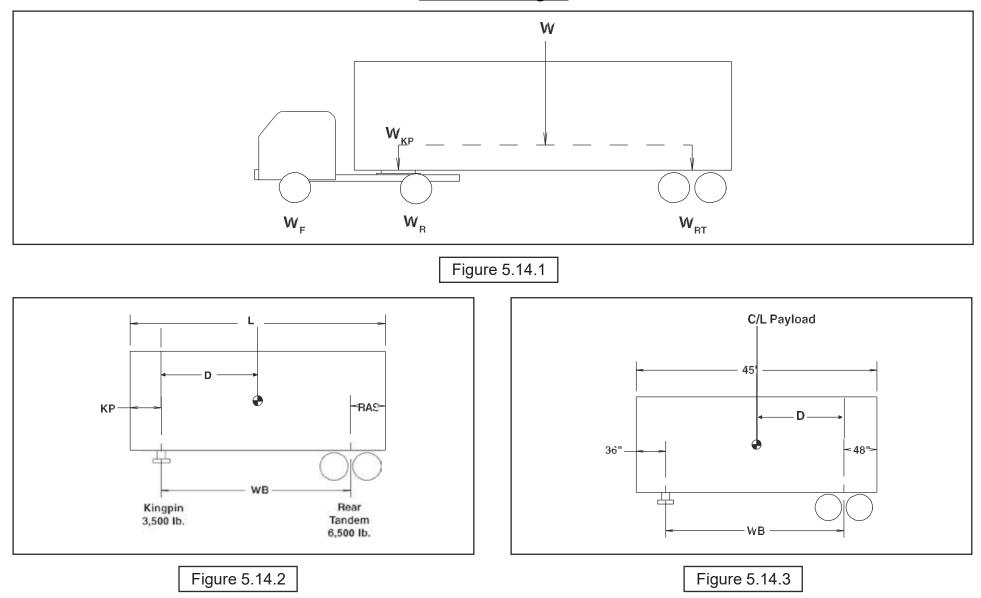

Calculating tractor/trailer weight distribution can be thought of in the same terms as calculating full trucks.

The weight at the center of the body and the load when applied is the same as the single point load of the kingpin on the fifth wheel.

Trailer Weight

In the following example, a 50,000-pound payload at water-level loading. Calculate the payload (PL) weight transfer to kingpin and the rear axle. **NOTE:** Apply the same principles used with truck chassis.

Trailer Weight

Payload at Kingpin

$$PL_{kp} = \frac{W \times D}{WB}$$

Calculate the "D" dimension.

OAL/2 – AF = D 45 feet/2 – 48 inches – 36 inches = 186 inches

 $PL_{kp} = \frac{50,000 \text{ lbs. x } 186 \text{ in.}}{456 \text{ in.}} = 20,394 \text{ lbs.}$

PL_{kn} =20,394 lbs.

Payload at Rear Tandem

 $PL_{H} = W - PL_{kn}$

 $PL_{\pi} = 50,000 \text{ lbs.} - 20,394 \text{ lbs.} = 29,606 \text{ lbs.}$

PL_{rt} = <u>29,606 lbs.</u>

Once the weight on the kingpin is determined, it can then be treated on the tractor the same as a weight on a straight truck.

Due to the variations in hauling and wheelbase requirements from one truck application to another, there is no one specific fifth wheel setting that will apply in all cases.

A "rule of thumb" which has proven satisfactory in many cases sets the fifth wheel one inch ahead of the rear axle for every 10 inches of wheelbase. In the case of tandem axles, the wheelbase is measured from the center line of the front axle to the midpoint between the tandem rear axles. The location of the fifth wheel fixes the load distribution between the front and rear axles. Too far forward and the front axle is overloaded. If too far back, the front axle may be too lightly loaded and cause an unsafe steering and braking control situation at the front axle.

2024 Chevrolet LCF

Trailer Weight

A tractor on a hill with the fifth wheel set at the axle center line or too close to it will result in an unsafe handling situation by transferring too much weight to the rear axle and actually unloading the front axle

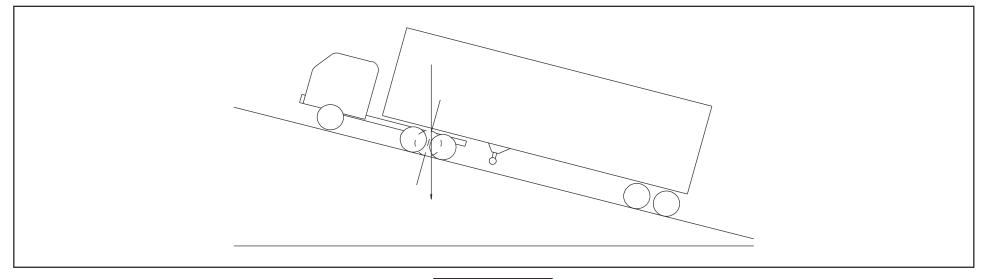

Figure 5.16.1

Performance Calculations

The following calculations have been included to help you determine the performance characteristics required by your customers and to select the appropriate model vehicle:

1. Speed Formula

This formula can be used to determine:

- 1. Top speed of the vehicle.
- 2. Speed in a given gear.
- 3. Final ratio required for a given speed.

MPH @ Governed Speed =

(60) x (RPM) (Rev/Mile) x (Gear Ratio)

Performance Calculations

Definitions in formula:

RPM	=	Revolutions per minute of the engine at Governed Speed
Rev/Mile	=	Tire revolutions per mile
Gear Ratio	=	The product of the axle ratio times the transmission ratio
60	=	Time Constant

Example: 3500 12,000 GVWR automatic transmission.

RPM	=	3,000
Rev/Mile	=	674
Gear Ratio	=	.703 x 5.375

MPH @ Governed Speed = $\frac{(60) \times (3,000)}{(674) \times (.703 \times 5.375)}$

MPH @ Governed Speed = 70 MPH

2. Grade Horsepower Formula

This formula can be used to determine horsepower required for a given grade and speed.

Horsepower Req'd. for a given grade	= GVWR x Grade x Speed	+ ΔHΡ
	37,500 x Efficiency Factor	т АПР

Definitions in formula:

GVWR	_	Gross Vehicle Weight Rating
GVWK	-	Gloss vehicle weight Rating
Grade	=	Grade anticipated in percent
Speed	=	Speed in miles per hour
37,500	=	Constant
Efficiency Factor	=	Factor for losses in drivetrain due to friction
		(use 0.9 for a 90% efficient driveline)
AHP Resistance	=	Horsepower required to overcome wind force

PAGE

5.17

Performance Calculations

Example: 3500 11,050 GVWR automatic transmission with a van body.

GVWR Grade Speed 37,500 Efficiency Factor AHP Resistance	= = = =	12,000 lbs. 1 percent 55 MPH Constant 0.9 53.6 HP (see the following formula for calculation)
HP Required for Grade	=	12,000 x 1 x 55

HP Required for Grade = 73.22

3. Air Resistance Horsepower Formula

This formula is used to determine the horsepower required to overcome air resistance at a given speed.

Air Resistance Horsepower =	FA x Cd x (MPH) ³	
	156,000	

Definitions in formula:

FA	=	Frontal area of vehicle in square feet
Cd	=	Aerodynamic Drag Coefficient
MPH	=	Speed of vehicle in miles per hour
156,000	=	Constant

Frontal area is calculated by multiplying the height of the vehicle by the width of the vehicle and subtracting the open area under the vehicle from the total.

Aerodynamic Drag Coefficients (Source Material: Motor Truck Engineering Handbook):

- 0.70 for most trucks, semitrailer combinations with tanks or van bodies
- 0.77 for double and triple trailers and flatbeds with loads

Performance Calculations

Example: 3500 12,000 GVWR van body with 96" wide, 115" high (84" body height + 31" frame height).

FA	=	(96) x (115)	- 3.2	
	-	(12) x (12)	- 3.2	
FA Cd Speed	= = =	73.47 ft.2 0.70 55 mph		
Air Resistance HP			=	73.47 x 0.70 x (55) ³ 156,000
Air Resistance HP			=	54.85

4. Engine Horsepower Formula

This formula can be used to derive the output at a given RPM and torque.

Horsepower	=	Torque x RPM
-		5,252

Definitions in formula:

Torque	=	Twisting output of engine given in lbsft.
RPM	=	Revolutions per minute of engine
5,252	=	Constant

Example: 3500 12,000 GVWR automatic transmission.

Torque	=	347 lbsft.
RPM	=	2,000
132 HP	=	(347) x (2,000)
		5,252

Performance Calculations

5. Gradeability Formula

This formula can be used to determine how large of a grade a vehicle can climb.

Percent Grade = 1,200 x (T) x (E) x (C) x (R)

– RR

GVWR x r

Definitions in formula:

1,200	=	Constant
Т	=	Maximum Torque of Engine
E	=	Engine Efficiency (0.9)
С	=	Driveline Efficiency (0.9)
R	=	Transmission Ration x Axle Ratio
RR	=	Rolling Resistance (see following chart)
GVWR	=	Gross Vehicle Weight Rating
r	=	Loaded radius of tire

Example: 350012,000 GVWR automatic transmission on concrete highway.

T E C R R R G V W R r	= = = = =	0.9 0.9 .70 1.0 12,) 3 x 5.375 (in overdrive)	
Percent G	rade	=	1,200 x (347) x (0.9) x (0.9) x (.703) x (5.375)	- 1.0
			12,000 x 14.1	- 1.0
Percent G	rade	=	7.53 - 1	

Gradeability = 6.53%

PAGE

5.20

Performance Calculations

		ing Resistance	
	Road Rolling Resistance	- Expressed in Percent Grade	
Road Surface	Grade Road	Surface	Grade
Concrete, excellent	1.0	Cobbles, ordinary	5.5
Concrete, good	1.5	Cobbles, poor	8.5
Concrete, poor	2.0	Snow, 2 inches	2.5
Asphalt, good	1.25	Snow, 4 inches	3.75
Asphalt, fair	1.75	Dirt, smooth	2.5
Asphalt, poor	2.25	Dirt, sandy	3.75
Macadam, good	1.5	Mud	3.75 to 15.0
Macadam, fair	2.25	Sand, level soft	6.0 to 15.0
Macadam, poor	3.75	Sand, dune	16.0 to 30.0

Figure 5.21.1

- 10%

6. Startability Formula

This formula is used to determine what type of a grade a vehicle can be started on.

Startability =(1,200) x (CET) x (E) x (C) x (R)Definitions in formula:(GVWR x r)

1,200	=	Constant
CET	=	Clutch Engagement Torque
E	=	0.9
С	=	0.9
R	=	Transmission x Axle Ratio
10%	=	Average break away resistance and static inertia constant
GVWR	=	Gross Vehicle Weight Rating
r	=	Loaded radius of tire

Performance Calculations

Example: 3500 LCF 12,000 GVWR manual transmission.

CET R GVWR r	= = = =	260 lbsft. 6.02 x 4.10 12,000 lbs. 14.1 in.	
Startability	=	(1,200) x (260) x (0.9) x (0.9) x (6.02 x 4.10) (12,000 x 14.1)	- 10%
Startability	=	26.86%	

7. Vertical Center of Gravity Formula

These formulas are used to estimate the vertical center of gravity of a completed vehicle in order to determine whether maximum allowable limits have been exceeded. This formula should be used when encountering high center of gravity loads.

7.1 Wv x (Vv) =Μv 7.2 Wb x (Vb) =Mb 7.3 Wp x (Vp) =Mp 7.4 We x (Ve) = Me

(Mv+ Mb+Mp+Me) 7.5 VCg =

(Wv + Wb + Wp + We)

Definitions in formula:

- VCg = The total average vertical center of gravity of the completed vehicle (vehicle, body, payload and equipment)
- = Weight of vehicle Wv
- = Weight of body Wb
- Weight of payload = Wp
- = Weight of equipment We

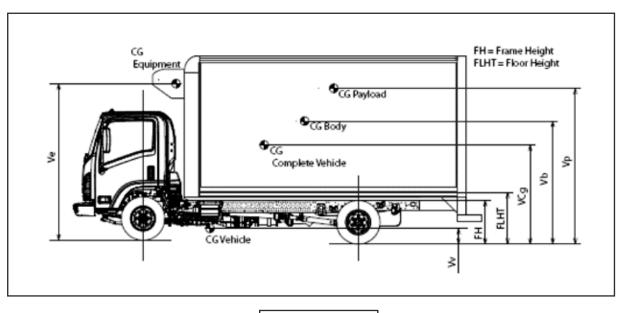

Figure 5.22.1

Performance Calculations

Definitions in formula (continued):

Vv = Distance from ground to center of gravity of the vehicle = Distance from ground to center of gravity of the body Vb Distance from ground to center of gravity of the pavload Vp = = Distance from ground to center of gravity of the equipment Ve Moment of vehicle Μv = Mb = Moment of body Moment of payload Mp = Moment of equipment Me =

Example: 3500 12,000 GVWR automatic transmission, 132" WB, 14' body length, 84" high body, full payload of boxes stacked to a maximum height of 48" above the flooring.

Wv 5.291 lbs. (from vehicle specifications) = Wb = 2,100 lbs. (from body manufacturer) 4,609 lbs. Wp = (GVWR - (Wv + Wb + We))= 24.9 in. (from Body Builder's Guide, 3500 Section) Vv (from body manufacturer) Vb = 80 in. = 62 in. (1/2 of payload height + frame height + height from frame to flooring) Vp = 5,291 x 24.9 = 131,746 lbs.-in. (from 7.1) Μv Mb = $2,100 \times 80 = 168,000$ lbs.-in. (from 7.2) Mp = 4,609 x 62 = 285,758 lbs.-in. (from 7.3)

inches

We, Ve, Me = None in this example

VCg =
$$\frac{(131,746+168,000+285,758)}{(5,291+2,100+4,609)}$$

VCg = $\frac{(528,504)}{(12,000)} = 48.8$

48.8 < 54.0 inches (54 inches is maximum allowable VCg per mfg. specifications from Body Builder's Guide, 3500 section) Since maximum VCg for this truck is not exceeded, 48" stack height above flooring is acceptable.

Performance Calculations

8. Horizontal Center of Gravity Formula

These formulas are used to estimate the horizontal center of gravity of a completed vehicle in order to determine whether it exists between the centerlines of the front and rear axles. This formula should be used when a load and/or permanent equipment (liftgate, reefer unit, snowplow, etc.) is installed on either extreme along the completed vehicle's overall length.

8.1 Wv x (Hv) = Mv

8.2 Wb x (Hb) = Mb

8.3 Wp x (Hp) = Mp

8.4 We x(He) = Me

(Mv+Mb+Mp+Me)

8.5 HCg

(Wv + Wb + Wp + We)

Definitions in formula:

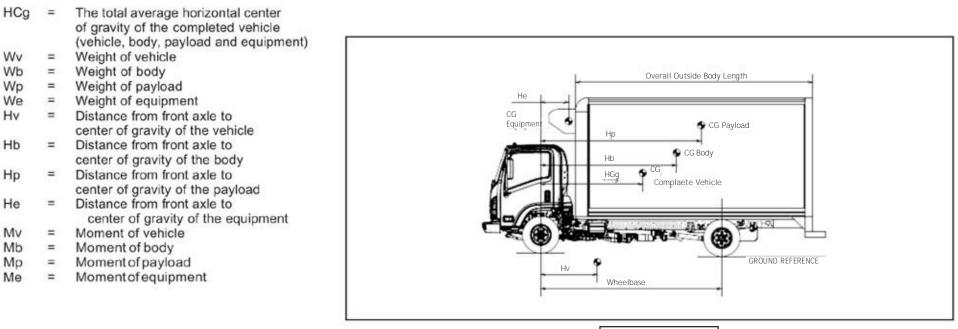

Figure 5.24.1

Performance Calculations

Example: 3500 Gas 12,000 GVWR automatic transmission, 132" WB, 14' body length, full payload of boxes stacked and distributed evenly throughout the flooring, 1,000 lb. reefer unit attached in front of body.

Wv Wb We Hv Hb Hp* He Mv Mb	= = = = = = =	2,100 x 107.5	(from vehicle specifications) (from body manufacturer) (GVWR – (Wv + Wb + We)) (from equipment manufacturer) (from Body Builder's Guide, 3500 Section) (from body manufacturer) (1/2 of payload length + distance from front axle to front of body) (from equipment manufacturer) 224,338 lbsin. (from 8.1) = 225,750 lbsin. (from 8.2) = 207 067 lbsin. (from 8.2)
Мр	=	3,609 x 107.5	= 387,967 lbsin. (from 8.3)
Me	=	1,000 x 17.5 =	17,500 lbsin. (from 8.4)
HCg	= <u>(22</u>		<u>+ 387,967+17,500)</u>) + 3,609 + 1,000)
HCg	=	<u>(855,555)</u> =	71.3 inches

71.3 < 132 inches (132 inches is the wheelbase dimension)

(12,000)

Since HCg for this truck is not greater than the WB or negative (-) (denotes HCg forward of front axle centerline), it exists between the centerlines of the front and rear axles.

NOTE: Hp and Hb dimensions are the same in this example because CG of body and payload happen to be at the same point.

Bridge Formula Weights

To calculate maximum acceptable axle weights for use on the Interstate Highway System, use the Department of Transportation link shown below.

http://ops.fhwa.dot.gov/freight/sw/brdgcalc/calc_page.htm

<u>COMMODITY AND MATERIAL WEIGHTS</u>

Approximate Weights of Commodities and Materials

Product		Size of Container	Lbs. Per Cu. Ft.	No. of Lbs. / Per
Acetone			50	6.6 / gallon
Alcohol,	Commercial		51	6.8 / gallon

<u>3500/4500 12.0/14.5 GVW Gas-STD Cab – 3500 Gas Specifications</u>

MODEL	3500/4500
GVWR / GCWR	12,000 lbs. / 18,000 lbs., 14,500 lbs. / 20,500 lbs. (4500)
WB	109 in., 132.5 in., 150 in., 176 in.
ENGINE	GMPT L8T (Gen V), 8-cylinder, V Block 4-cycl, OHV, Direct Fuel Injection, Oil Jet Piston Cooling
MODEL/DISPLACEMENT	GMPT- 8/400 CID (6.6 liters)
HP (GROSS)	350 HP @ 4500 RPM
TORQUE (GROSS)	425 lbft. @ 3800 RPM
EQUIPMENT	Direct injection technology, mass air flow meter, powertrain interface module (PIM), onboard diagnostics, oxygen sensors, catalytic convertor, map sensor, with external oil cooler, engine cruise control, and rear engine cover.
TRANSMISSION	6L90 Hydra-Matic 6-speed automatic with lock-up converter and double overdrive. No PT opening.
STEERING	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.
FRONT AXLE	Reverse Elliot "I" -beam rated at 6,830 lbs.
FRONT SUSPENSION	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.
FRONT GAWR	4,860 lbs. / 6,630 lbs. (4500)
REAR AXLE	Full floating single speed with hypoid gearing rated at 14,550 lbs.
REAR SUSPENSION	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.
REAR GAWR	8,840 lbs. / 11,020 lbs. (4500)
WHEELS	16 x 6.0 - 6-hole disc wheels, painted white. 19.5 x 6.0 (4500)
TIRES	215/85R-16E (10 ply), 225/70R-19.5 (14 Ply) (4500) LRR (Low Rolling Resistance) tubeless steel belted radials, all season front and rear
BRAKES	Dual circuit vacuum assisted hydraulic service brakes with EBD (Electronic Brake Distribution) system for load proportioning of the brake system front disc and self-adjust outboard mounted drum rear. The parking brake is a mechanical, cable actuated, internal expanding drum type, transmission mounted. 4 channel anti-lock brake system.
FUEL TANK	38.6 gal. rectangular stainless-steel fuel tank. Mounted between the frame rails with electric type fuel pump (mounted in tank) and fuel tank zone module (mounted on rearward crossmember). Through the rail fuel fill.
FRAME	Ladder type channel section straight frame rail 33.5 inches wide through the total length of the frame. Yield strength 44,000 psi, section modulus 7.20 in ³ ., RBM 316,800 lb-in
САВ	All steel, low cab forward, BBC 70.9 in, 45° mechanical tilt with torsion assist.
CAB EQUIPMENT	TRICOT breathable cloth covered high back driver's seat with two occupant passenger seat. Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column. Power windows and door locks, floor mats, tinted glass. AM/FM/CD Radio with Aux input/USB port and Bluetooth. Rear body dome lamp switch. Cab latch switch and indicator with buzzer.
ELECTRICAL	12-volt, negative ground, 750 CCA maintenance free battery located on frame, 170 Amp alternator with integral regulator.
OPTIONS	See last page for options.
í

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-STD Cab - Vehicle Weight Limits

Vehicle Weight Limits:

GVWR Designed Maximum	14,500 lbs.
GAWR, Front	5,360 lbs.

GAWR, Rear 9,880 lbs.

Technical Notes:

Chassis Curb Weight reflects standard equipment and fuel but no driver or payload.

Maximum Payload Weight is the allowed maximum for equipment, body, payload and driver and is calculated by subtracting chassis curb weight from the GVWR.

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-STD Cab - Opening Diagram

Aisin A460 Automatic Torque Converter Lock Up Function

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM.

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the transmission from the stationary mode.

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-STD Cab - In-Frame Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Remove the short filler hose and the short breather hose from the breather and fuel filler pipes and the filler neck bracket assembly.
- 3. Filler kit hoses are designed for the 102 inch wide body width. Modify the hoses as required to fit the desired body width (Figure 15 Dimension D).
- 4. Install flexible filler hose (Item 1) to fuel filler pipe and filler neck bracket assembly using existing screw clamps.
- 5. Install flexible breather hose (Item 2) to fuel breather pipe and filler neck bracket assembly using new clamps (item 3)
- 6. The filler neck must be mounted to allow the filler neck bracket to be parallel to the frame horizontal.
- 7. Filler neck (Figure 14 Dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 8. Secure the filler plate and ground strap to the bottom of the body and check for leaks. Ground straps should be connected to brackets or flanges, not the fuel filler hose or breather hose. Ground straps should have a minimum of 10mm clearance, in all deflected positions, from any metallic portions of the fuel filler hose or breather hose assembly.
- 9. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 10. Reconnect battery.

Fuel Type

Use regular unleaded gasoline rated at 87 octane or higher that meets specification ASTMD4814 in the U.S. Blended gasoline is suitable

for use in the LCF Gas Chassis.

Ethanol is ethyl or grain alcohol. Properly-blended fuel that is no more than 10% ethanol is fine for your vehicle. NOTICE:

Fuel that is 15% Ethanol is not suitable for your vehicle. Fuel that is than 85% Ethanol is not suitable for your vehicle. Methanol is

methyl or wood alcohol.

NOTICE:

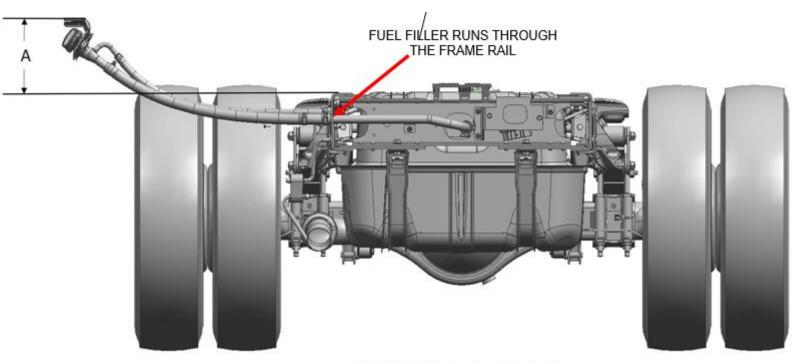

- 6.6L Engine: Fuel that is more than 5% methanol is bad for your vehicle. And even at 5% or less, there must be "co-solvents" and corrosion preventives in this fuel to help avoid damage to the fuel system from methanol.

- 6.0L Engine: Methanol-Gasoline mixtures are not suitable for your vehicle.

<u>3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-STD Cab – Installation Instructions</u>

and Considerations

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is located on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 8.30.1*. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figure 8.30.2*.

Figure 8.30.1

Figure 8.30.2

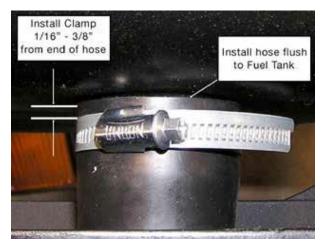

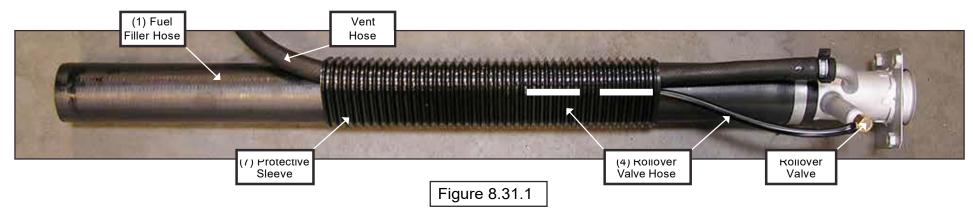

Figure 8.30.3

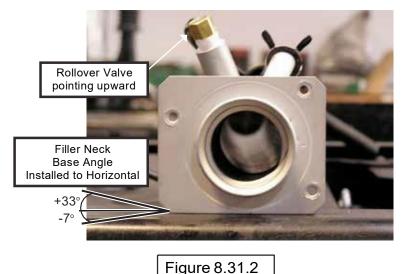

3500/4500 12.0/14.5 GVW Gas-STD Cab - Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 8.31.1*.

Filler Neck Installation

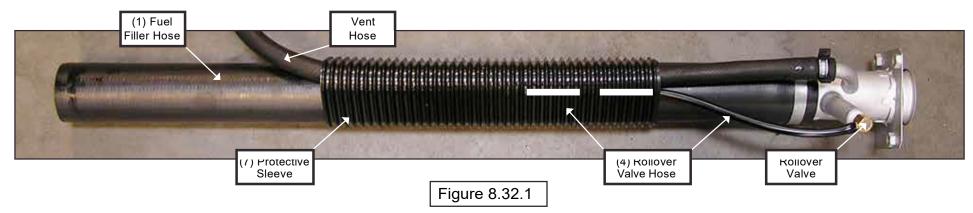

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 8.31.2* for the proper orientation.

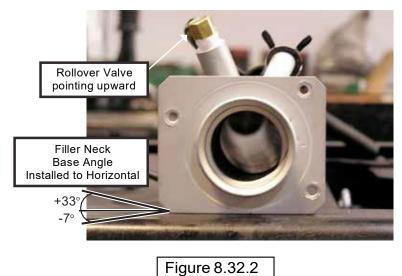

3500/4500HD 12.0/14.5 GVW Gas-STD Cab - Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 8.32.1*.

Filler Neck Installation

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 8.32.2* for the proper orientation.

5500 17,950/19,500 GVW Gas-Crew Cab – 5500 HG, XG Gas Specifications

MODEL	5500 HG, XG Crew Cab Gas
GVWR / GCWR	17,850 / 23,950 lbs. HG, 19,500 / 25,500 lbs. XG
WB	150 in., 176 in.
ENGINE	GMPT L8T (Gen V), 8-cylinder, V Block 4-cycl, OHV, Direct Fuel Injection, Oil Jet Piston
	Cooling
MODEL/DISPLACEMENT	GMPT- 8/400 CID (6.6 liters)
HP (GROSS)	350 HP @ 4500 RPM
TORQUE (GROSS)	425 lbft. @ 3800 RPM
EQUIPMENT	Direct injection technology, mass air flow meter, powertrain interface module (PIM), onboard
	diagnostics, oxygen sensors, catalytic convertor, map sensor, with external oil cooler,
	engine cruise control, and rear engine cover.
TRANSMISSION	Allison 1000 RDS 6-speed automatic with lock-up converter and double overdrive. No PTO
	opening.
STEERING	Integral power stearing 19.9.20 0:1 ratio. Tilt and telescoping stearing column
STEERING	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.
FRONT AXLE	Reverse Elliot "I" -beam rated at 8,440 lbs.
FRONT AXLE	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.
FRONT GAWR	6,830 lbs. HG / 8,440 lbs. XG
FRONT GAWR	0,030 lbs. HG / 0,440 lbs. AG
REAR AXLE	Full floating single speed with hyperid genuing yets diet 44 550 kg
REAR AXLE	Full floating single speed with hypoid gearing rated at 14,550 lbs.
REAR SUSPENSION	Semi-elliptical steel alloy multi-leaf springs and shock absorbers. 13,660 lbs. HG / 14,460 lbs. XG
REAR GAWR	13,000 IDS. HG / 14,400 IDS. XG
WHEELS	19.5 x 6.0 - 6-hole disc wheels, painted white.
TIRES	
TIRES	225/70R-19.5 (14 ply) LRR (Low Rolling Resistance) tubeless steel belted radials, all season front and rear
BRAKES	Dual circuit vacuum assisted hydraulic service brakes with EBD (Electronic Brake
BRARES	Distribution) system for load proportioning of the brake system front disc and self-adjust
	outboard mounted drum rear. The parking brake is a mechanical, cable actuated, internal
	expanding drum type, transmission mounted. 4 channel anti-lock brake system.
FUEL TANK	38.6 gal. rectangular stainless-steel fuel tank. Mounted between the frame rails with electric
	type fuel pump (mounted in tank) and fuel tank zone module (mounted on rearward
	crossmember). Through the rail fuel fill.
FRAME	Ladder type channel section straight frame rail 33.5 inches wide through the total length of
	the frame. Yield strength 44,000 psi, section modulus 7.20 in ³ ., RBM 316,800 lb-in
	3 ()
САВ	All steel, low cab forward, BBC 70.9 in, 45° mechanical tilt with torsion assist.
CAB EQUIPMENT	TRICOT breathable cloth covered high back driver's seat with two occupant passenger
	seat. Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping
	steering column. Power windows and door locks, floor mats, tinted glass. AM/FM/CD Radio
	with Aux input/USB port and Bluetooth. Rear body dome lamp switch. Cab latch switch and
	indicator with buzzer.
ELECTRICAL	12-volt, negative ground, 750 CCA maintenance free battery located on frame, 170 Amp
	alternator with integral regulator.

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-Crew Cab – Vehicle Weight Limits

Vehicle Weight Limits:

GVWR Designed Maximum	16,000 lbs.
GAWR, Front	6,660 lbs.
GAWR, Rear	11,020 lbs.

Technical Notes:

Chassis Curb Weight reflects standard equipment and fuel but no driver or payload.

Maximum Payload Weight is the allowed maximum for equipment, body, payload and driver and is calculated by subtracting chassis curb weight from the GVWR.

150	23.3	49.9	N/A					
176	23.3	57.2	52.5					

Figure 9.13.1

The maximum vertical center of gravity specified below must not be exceeded at maximum GVWR and rated front and rear GAWR. The Center of Gravity (CG) maximum is 63" (1600 mm) above the ground. (LCF Cab Chassis and LCF Stripped Chassis)

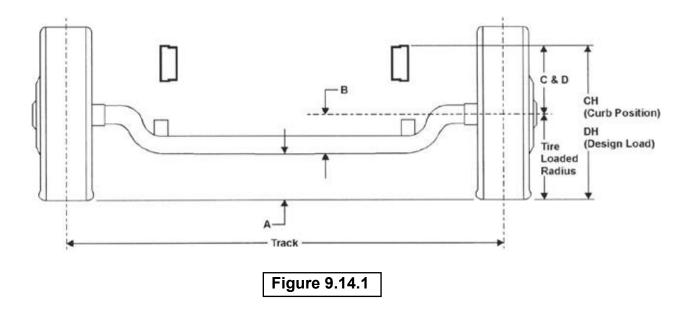

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

The maximum dimensions for a body installed on the LCF chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us at GMUpfitter.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-Crew Cab - Front Axle Chart

Formulas for calculating height dimensions:

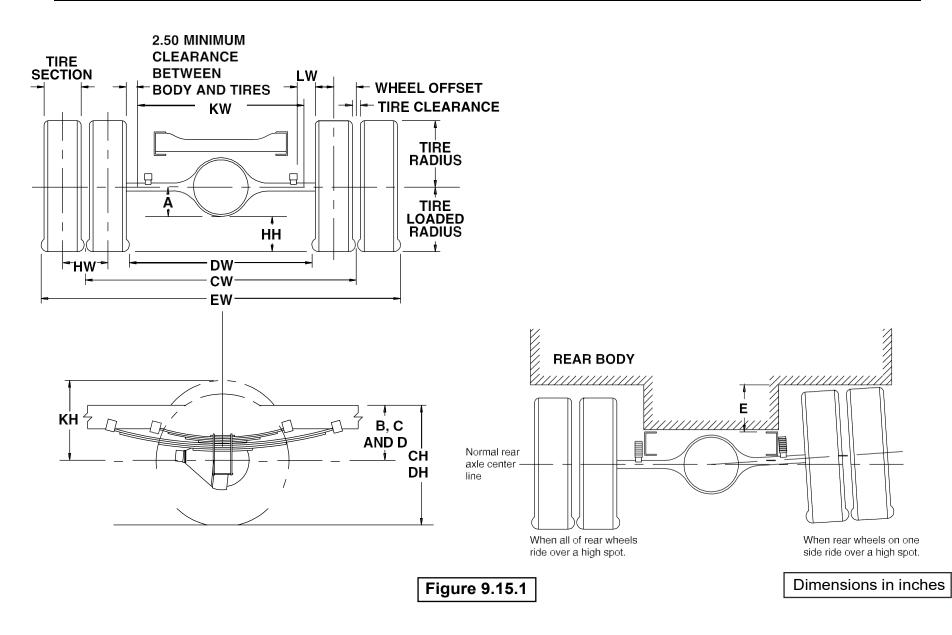

- A = Tire Loaded Radius -B
- C = Centerline of Axle to Top of Frame Rail at Curb Position
- D = Centerline of Axle to Top of Frame Rail at Design Load
- CH = C + Tire Unloaded Radius
- DH = D + Tire Loaded Radius

Tire	GVWR	GAWR	А	В	С	D	СН	DH	Track	Tire F	Radius

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-Crew Cab - Opening Diagram

Aisin A460 Automatic Torque Converter Lock Up Function

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM.

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the transmission from the stationary mode.

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-Crew Cab - In-Frame Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

3500/4500/5500 12.0/14.5 17,950/19,500GVW Gas-Crew Cab – Installation Instructions

and Considerations

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is located on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 9.30.1*. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figure 9.30.2*.

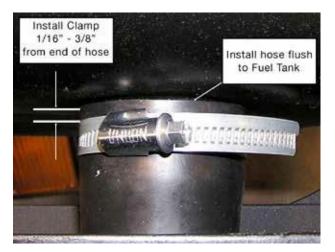

Figure 9.30.1

Figure 9.30.2

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16 and 3/8 from the tank. This is shown in *Figure 9.30.3* to the right.

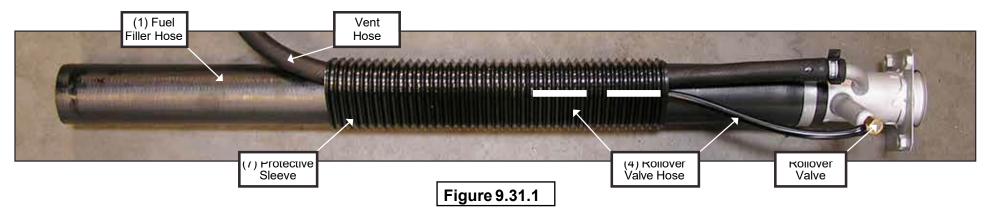

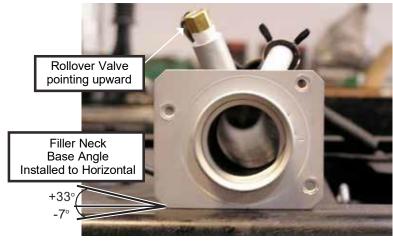

3500/4500/5500 12.0/14.5 17,950/19,500 GVW Gas-Crew Cab - Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 9.31.1*.

Filler Neck Installation

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 9.31.2* for the proper orientation.

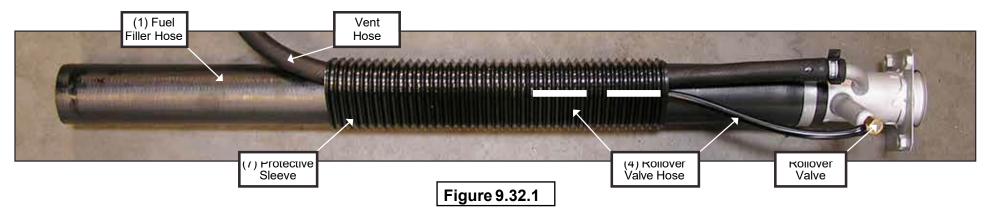

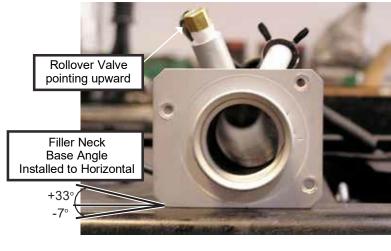

3500/4500HD 12.0/14.5 GVW Gas-Crew Cab - Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 9.32.1*.

Filler Neck Installation

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 9.32.2* for the proper orientation.

4500HG Diesel STD Cab Specifications

MODEL	4500HG Diesel - STD Cab
GVWR	14,500 lbs.
WB	109 in, 132.5 in, 150 in. 176 in.
ENGINE	Isuzu 4-cylinder, in-line 4-cycle, turbocharged, intercooled, direct injection diesel.
Model/Displacement	4HK1-TC/317 CID (5.19 liters)
HP (Gross)	14,500 GVWR 215 HP @ 2500 RPM w Automatic Transmission
Torque (Gross)	14,500 GVWR 452 lb/ft torque @ 1850 RPM w/ Automatic Trans
Equipment	Dry element air cleaner with vertical intake; 2 rows 564 in². radiator; 7 blade 20.1in diameter fan with viscous drive. Cold weather
	starting device and an oil cooler. Engine oil level check. Engine warning system with audible warning for low oil pressure,
	high coolant temperature, and low coolant level. Engine cruise control function. Rear engine cover.
TRANSMISSION	Aisin A465 6 speed automatic transmission with fifth and sixth gear overdrive with lock up in 2nd, 3rd, 4th, 5th and 6th.
	PTO capability with automatic torque converter lockup in stationary PTO mode.
STEERING	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.
FRONT AXLE	Reverse Elliot I" -Beam rated at 6,830 lbs.
Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.
GAWR	5,360 lbs.
REAR AXLE	Full floating single speed with hypoid gearing rated at 11,020 lbs.
Suspension	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.
GAWR	9,880 lbs.
WHEELS	16x6.0-K 6 hole disc wheels, painted white.
TIRES	215/85R-16E (10 pr) LRR (Low Rolling Resistance) tubeless steel belted radials, all season front and rear.
BRAKES	Dual circuit vacuum assisted hydraulic service brakes with EBD
	(Electronic Brake Distribution) system for load proportioning of the brake system front disc and self-ad just outboard mounted
	drum rear. The parking brake is a mechanical, cable actuated, internal expanding drum type, transmission mounted. The exhaust brake is standard and is
	vacuum operated. 4 channel anti-lock brake system.
FUEL TANK	30 gal. (Opt. 35 or 55 gal.) rectangular steel fuel tank mounted in frame rail behind rear axle. Fuel water separator with indicator light on instrument cluster.
FRAME	Ladder type channel section straight frame rail 33.5 in wide
	through the total length of the frame. Yield strength 44,000 psi, section modulus 7.20 in3. RBM 316,800.
CAB	All steel low cab forward, BBC 70.7 in, 45° mechanical tilt with torsion assist.
Equipment	TRICOT breathable cloth covered high back driver's seat with two occupant passenger seat. Dual cab mounted exterior mirrors with integral convex mirror, AM/FM CD stereo radio. Tilt and telescoping steering column. Power windows and door locks, floor mats, tinted glass.
ELECTRICAL	12 Volt, negative ground, dual maintenance free batteries, 750 CCA each, 140 Amp alternator with integral regulator.
OPTIONS	See last page for options
	NOTE: These selected specifications are subject to change without notice.

176	22.0	55.0	50.3						

Figure 10.16.1

The maximum vertical center of gravity specified below must not be exceeded at maximum GVWR and rated front and rear GAWR. The Center of Gravity (CG) maximum is 63" (1600 mm) above the ground. (LCF Cab Chassis and LCF Stripped Chassis)

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

The maximum dimensions for a body installed on the LCF chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us on GMUpfitter.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

Aisin A460 Automatic Torque Converter Lock Up Function

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM.

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the transmission from the stationary mode.

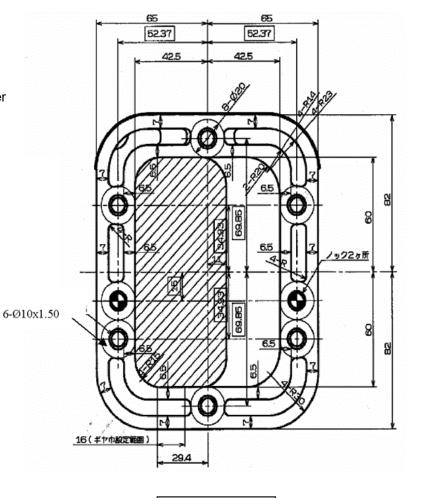

Figure 10.26.1

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

In-Frame Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

Figure 10.30.2

"A" Dimensions:

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door , the decal should be placed above or to the side of the fuel door.

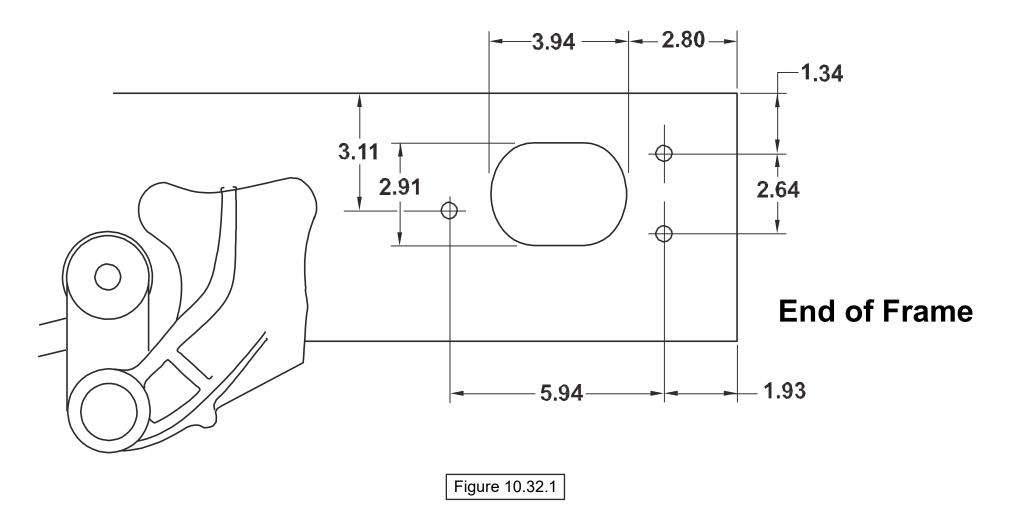

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

4500HG Diesel Fuel Filler Kit Instructions

Please review these instructions prior to installation of the fuel filler kit.

Parts Kit: There is a parts kit for the Chevrolet LCF diesel product. Fuel filler kit shown below is used for 14,500 lb and higher GVWR chassis (3500HD, 4500HG, 4500XG, 5500HG, 5500XG). Parts list is shown in *Figure 10.33.2*. Parts photos are shown in *Figure 10.33.1*.

FUEL FILLER KIT									
ITEM #	PART NAME	PART #	QTY						
1	HOSE: FUEL FILLER NECK	**	1						
2	HOSE: FUELFILLER	**	1						
3	CAP: FILLER	**	1						
4	HOSE: ROLL-OVER VALVE	**	1						
5	NECK ASM: FUEL FILLER	**	1						
6	CLIP: JOINT	**	4						
7	PROTECTOR: FILLER HOSE	**	1						
8	CLIP: BAND, HOSE FIXING	**	2						
9	CLIP: RUBBER, HOSE	**	1						
10	BRACKET: FILLER NECK	**	1						
11	SCREW: FILLER NECK	**	3						
12	CAUTION PLATE	**	1						
13	SHUTTER: FUEL TANK	**	1						

** See Dealer for all part numbers.

Figure 10.33.2

Installation Instructions and Considerations

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is located on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 10.34.1*. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figure 10.34.2*.

Figure 10.34.1

Figure 10.34.2

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16"and 3/8" from the tank. This is shown in *Figure 10.34.3* to the right.

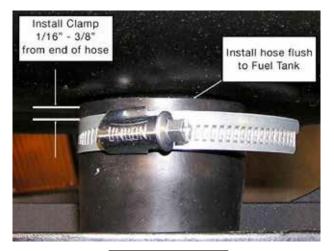

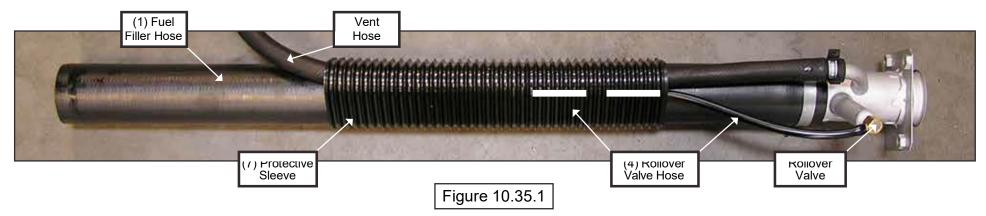

Figure 10.34.3

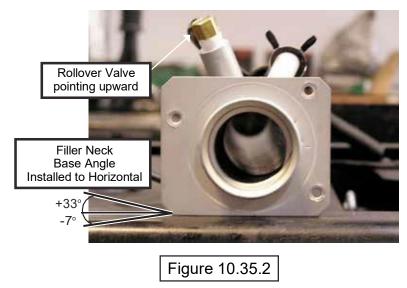

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 10.35.1*.

Filler Neck Installation

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 10.35.2* for the proper orientation.

11.1

4500XG Diesel - STD Cab Specifications

MODEL	4500XG Diesel - STD Cab						
GVWR	16,000 lbs.						
WB	109 in, 132.5 in, 150 in. 176 in.						
ENGINE	Isuzu 4-cylinder, in-line 4-cycle, turbocharged, intercooled, direct injection diesel.						
Model/Displacement	4HK1-TC/317 CID (5.19 liters)						
HP (Gross)	215 HP @ 2500 RPM w/ Automatic Transmission						
Torque (Gross)	452 lb/ft torque @ 1850 RPM w/ Automatic Transmission						
Equipment	Dry element air cleaner with vertical intake; 2 rows 564 in². radiator; 7 blade 20.1in diameter fan with viscous drive. Cold weather						
	starting device and an oil cooler. Engine oil level check. Engine warning system with audible warning for low oil pressure,						
	high coolant temperature, and low coolant level. Engine cruise control function. Rear engine cover.						
TRANSMISSION Aisin A465 6 speed automatic transmission with fifth and sixth gear overdrive with lock up in 2nd, 3rd, 4th, 5th and 6							
	PTO capability with automatic torque converter lockup in stationary PTO mode.						
STEERING	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.						
FRONT AXLE	Reverse Elliot I" -Beam rated at 6,830 lbs.						
Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.						
GAWR	6,630 lbs.						
REAR AXLE	Full floating single speed with hypoid gearing rated at 11,020 lbs.						
Suspension	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.						
GAWR	11,020 lbs.						
WHEELS	19.5x6.0-K 6 hole disc wheels, painted white						
TIRES	225/70R-19.5 F (12 pr) LRR (Low Rolling Resistance) tubeless steel belted radials, all season, front and rear.						
BRAKES	Dual circuit vacuum assisted hydraulic service brakes with EBD						
	(Electronic Brake Distribution) system for load proportioning of the brake system front disc and self-ad just outboard mounted						
	drum rear. The parking brake is a mechanical, cable actuated, internal expanding drum type, transmission mounted. The exhaust brake is standard and is						
	vacuum operated. 4 channel anti-lock brake system.						
FUEL TANK	30 gal. (Opt. 35 & 55 gal.) rectangular steel fuel tank mounted in frame rail behind rear axle. Fuel water separator with indicator light on instrum ent cluster.						
FRAME	Ladder type channel section straight frame rail 33.5 in wide						
	through the total length of the frame. Yield strength 44,000 psi, section modulus 7.20 in3. RBM 316,800.						
САВ	All steel low cab forward, BBC 70.7 in, 45° mechanical tilt with torsion assist.						
Equipment	TRICOT breathable cloth covered high back driver's seat with two						
	occupant passenger seat. Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column. Power						
	windows and door locks, floor mats, tinted glass.						
ELECTRICAL	12 Volt, negative ground, dual maintenance free batteries, 750 CCA each, 140 Amp alternator with integral regulator.						
OPTIONS	See last page for options						
	NOTE: These selected specifications are subject to change without notice.

Figure 11.16.1

The maximum vertical center of gravity specified below must not be exceeded at maximum GVWR and rated front and rear GAWR. The Center of Gravity (CG) maximum is 63" (1600 mm) above the ground. (LCF Cab Chassis and LCF Stripped Chassis)

Figure 11.16.2

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

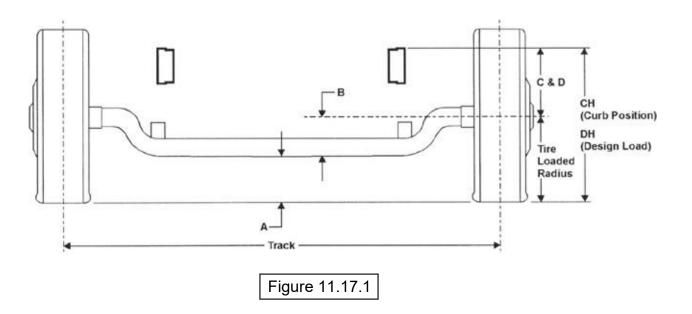

The maximum dimensions for a body installed on the LCF chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us at GMUpfitter.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

Aisin A460 Automatic Torque Converter Lock Up Function

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM.

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the transmission from the stationary mode.

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

In-Frame Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

"A" Dimensions:

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door , the decal should be placed above or to the side of the fuel door.

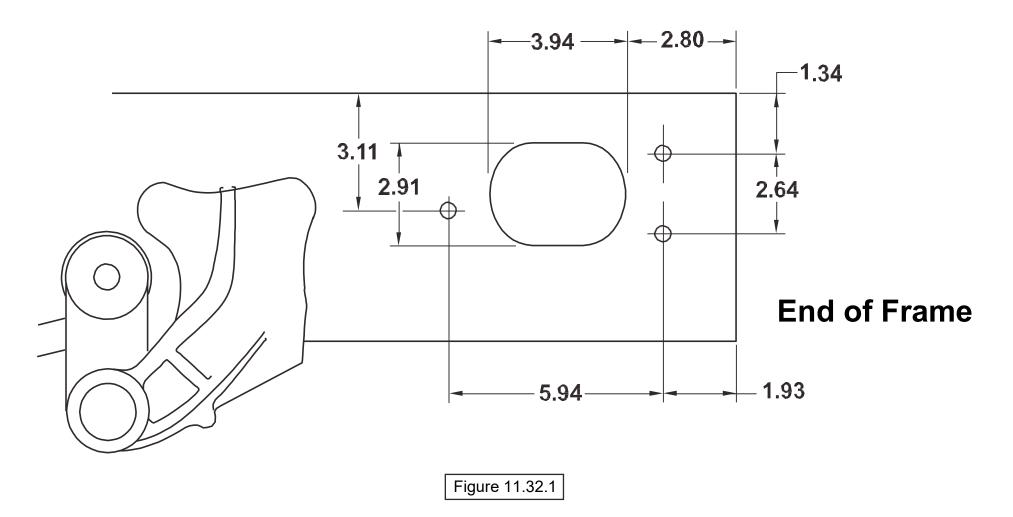

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

4500XG Diesel Fuel Filler Kit Instructions

Please review these instructions prior to installation of the fuel filler kit.

Parts Kit: There is a parts kit for the Chevrolet LCF diesel products. Fuel filler kit shown below is used for 14,500 lb and higher GVWR chassis (3500HD, 4500HG, 4500XG, 5500HG, 5500XG). Parts list is shown in *Figure 33.33.2*. Parts photos are shown in *Figure 11.33.1*.

FUEL FILLER KIT					
ITEM #	PART NAME	PART #	QTY		
1	HOSE: FUEL FILLER NECK	**	1		
2	HOSE: FUELFILLER	**	1		
3	CAP: FILLER	**	1		
4	HOSE: ROLL-OVER VALVE	**	1		
5	NECK ASM: FUEL FILLER	**	1		
6	CLIP: JOINT	**	4		
7	PROTECTOR: FILLER HOSE	**	1		
8	CLIP: BAND, HOSE FIXING	**	2		
9	CLIP: RUBBER, HOSE	**	1		
10	BRACKET: FILLER NECK	**	1		
11	SCREW: FILLER NECK	**	3		
12	CAUTION PLATE	**	1		
13	SHUTTER: FUEL TANK	**	1		

** See Dealer for all part numbers.

Figure 11.33.2

Installation Instructions and Considerations

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is located on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 11.34.1*. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figure 11.34.2*.

Figure 11.34.1

Figure 11.34.2

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16"and 3/8" from the tank. This is shown in *Figure 11.34.3* to the right.

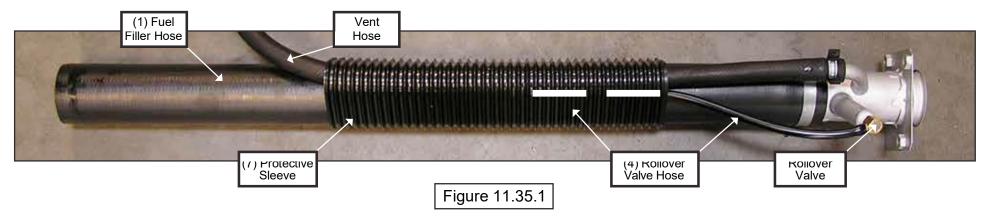

Figure 11.34.3

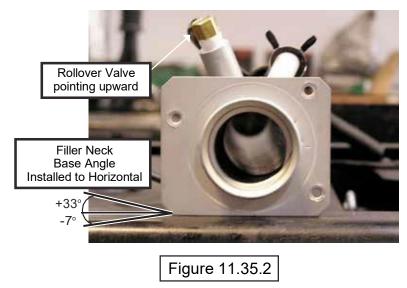

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 11.35.1*.

Filler Neck Installation

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 11.35.2* for the proper orientation.

5500HG Diesel - STD Cab Specifications

Model	5500HG - STD Cab						
GVWR	17,950 lbs.						
WB	109 in., 132.5 in., 150 in., 176 in., 200 in.*						
Engine	Isuzu 4-cylinder, in-line 4-cycle, turbocharged, intercooled, direct injection diesel.						
Model/Displacement	4HK1-TC/317 CID (5.19 liters)						
HP (Gross)	215HP/2500 RPM w/Automatic Transmission						
Torque (Gross)	452 lb ft torque/1850 RPM w/ Automatic Transmission						
Equipment	Dry element air cleaner with vertical intake; 2 rows 564 square in ² . radiator; 7 blade 20.1 in diameter fan with viscous drive.						
	Cold weather starting device and an oil cooler. Engine oil level check. Engine warning system with audible						
	warning for low oil pressure, high coolant temperature, and low coolant level. Engine cruise control function.						
	Rear engine cover.						
Transmission	Aisin A465 6 speed automatic transmission with fifth and sixth gear overdrive with lock up in 2nd, 3rd, 4th, 5th and 6th,						
	PTO capability with automatic torque converter lockup in stationary PTO mode.						
Steering	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.						
Front Axle	Reverse Elliot I" -Beam rated at 6,830 lbs.						
Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.						
GAWR	6,830 lbs.						
Rear Axle	Full floating single speed with hypoid gearing rated at 14,550 lbs.						
Suspension	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.						
GAWR	14,550 lbs.						
Wheels	19.5x6.0-K 6 hole disc wheels, painted white.						
Tires	225/70R-19.5E (12 pr) LRR (Low Rolling Resistance) tubeless steel belted radials, all season tread front and rear.						
Brakes	Dual circuit power assisted hydraulic service brakes with EBD (Electronic Brake Distribution) system for load proportioning						
	of the brake system front disc and self-adjust outboard mounted drum rear. The parking brake is mechanical, cable actuated,						
	internal expanding drum type, transmission mounted. The exhaust brake is standard and is vacuum operated.						
	4 channel antilock brake system.						
Fuel Tank	30 gal. (Opt. 35 & 55 gal.) rectangular steel fuel tank mounted in frame rail behind rear axle. Fuel water separator with indicator light.						
Frame	Ladder type channel section straight frame rail 33.5 in wide through the total length of						
	the frame. Yield strength 44,000 psi, section modulus 7.20 in 3. RBM 316,800.						
Cab	All steel low cab forward, BBC 70.9 in, 45o mechanical tilt with torsion assist.						
Equipment	TRICOT breathabke cloth covered high back driver's seat with two occupant passenger seat.						
	Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column.						
	Power windows and door locks, floor mats, tinted glass.						
Electrical	12 Volt, negative ground, dual maintenance free batteries, 750 CCA each, 140 Amp alternator with integral regulator.						
Options	See last page for options						
	NOTE: These calested encodifications are subject to sharp a without ratios						
	NOTE: These selected specifications are subject to change without notice.

Vehicle Weight Limits

Vehicle Weight Limits:

GVWR Designed Maximum 17,950 lbs.

GAWR, Front 6,830 lbs.

GAWR, Rear 12,980 lbs.

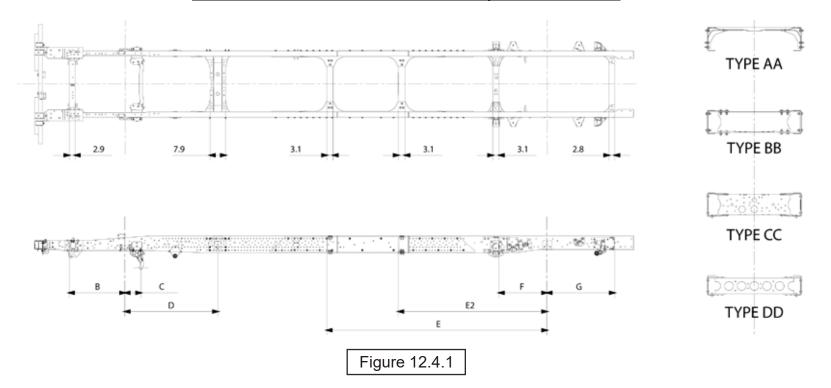

Technical Notes:

Chassis Curb Weight reflects standard equipment and fuel but no driver or payload.

Maximum Payload Weight is the allowed maximum for equipment, body, payload and driver and is calculated by subtracting chassis curb weight from the GVWR.

200	23.3	64.5	N/A			

Figure 12.16.1

Center of Gravity

The center of gravity of the chassis cab.

The maximum vertical center of gravity specified be- low must not be exceeded at maximum GVWR and rated front and rear GAWR. The Center of Gravity (CG) maximum is 63" (1600 mm) above the ground. (LCF Cab Chassis and LCF Stripped Chassis).

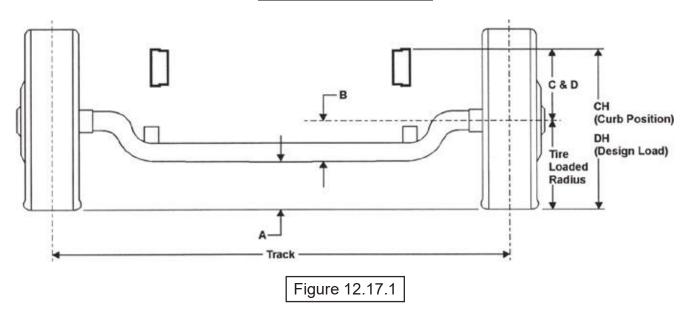

Figure 12.16.2

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

The maximum dimensions for a body installed on the N Series chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us on gmupfitters.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

Front Axle Chart

Opening Diagram

Aisin A460 Automatic Torque Converter Lock Up Function.

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the trasmission from the stationary mode.

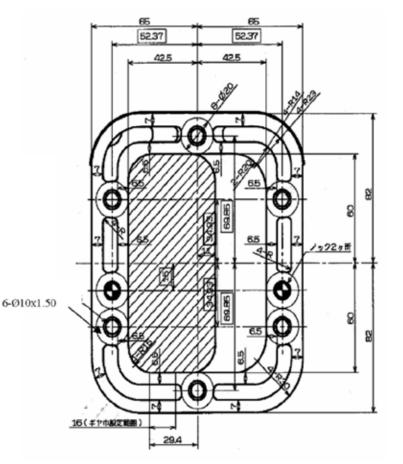

Figure 12.26.1

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

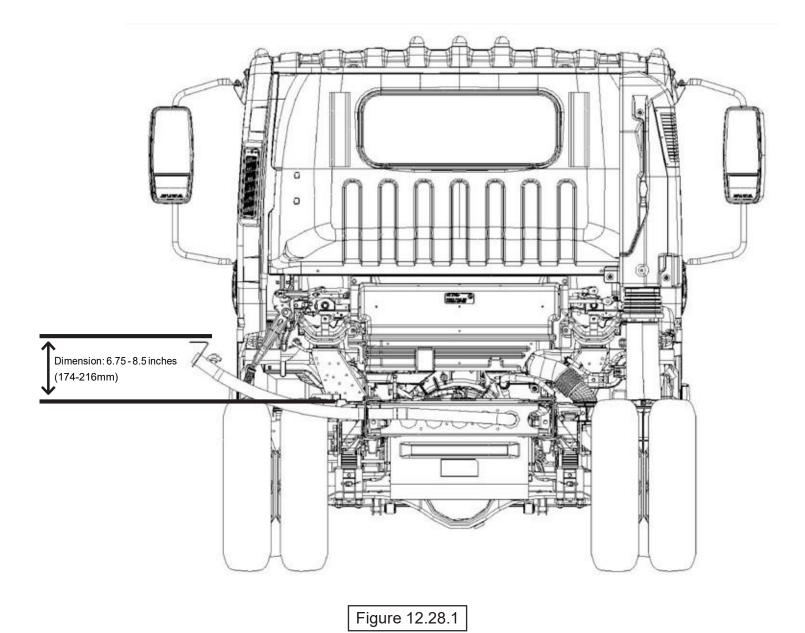

Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

Hose Modification for Various Width Bodies and Fuel Fill Vent Protection

NOTE: Shorten hose by "A Dimension" based on chart at left.

Figure 12.30.2

"A" Dimensions:

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door, the decal should be placed above or to the side of the fuel door.

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

5500HG-Diesel Fuel Filler Kit Instructions

Please review these instructions prior to installation of the fuel filler kit.

PARTS KIT: This a kit for the Chevrolet LCF diesel products. Fuel filler kit shown below is used for 14,500 lb and higher GVWR chassis 3500HD, 4500HG, 4500XG, 5500HG, 5500XG. Parts list is shown in **FIGURE 12.31.2**. Parts photos are shown in **FIGURE 12.31.1**.

	FUEL FILLER KIT		
ITEM #	PART NAME	PART #	QTY
1	HOSE: FUEL FILLER NECK	See Dealer	1
2	HOSE: FUEL FILLER	See Dealer	1
3	CAP: FILLER	See Dealer	1
4	HOSE: ROLL-OVER VALVE	See Dealer	1
5	NECK ASM: FUEL FILLER	See Dealer	1
6	CLIP: JOINT	See Dealer	4
7	PROTECTOR: FILLER HOSE	See Dealer	1
8	CLIP: BAND, HOSE FIXING	See Dealer	2
9	CLIP: RUBBER, HOSE	See Dealer	1
10	BRACKET: FILLER NECK	See Dealer	1

12	CAUTION PLATE	See Dealer	1
13	SHUTTER: FUEL TANK	See Dealer	1

Figure 12.33.2

Figure 12.33.1

Installation Instructions and Considerations:

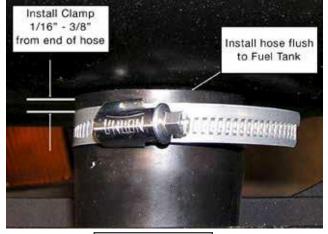

The fuel tank shutter valve (13) was a new component for 2011 model year. This component is meant to improve fuel splash-back performance of the fuel system. This valve (13) is on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in **FIGURE 12.34.1**. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in **FIGURES 12.34.2**.

Figure 12.34.1

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16" and 3/8" from the tank. This is shown in **FIGURE 12.34.3** below.

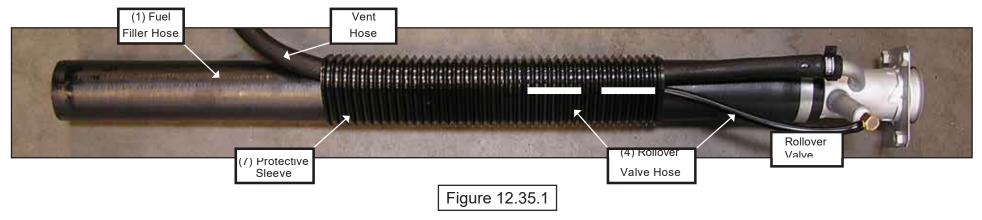

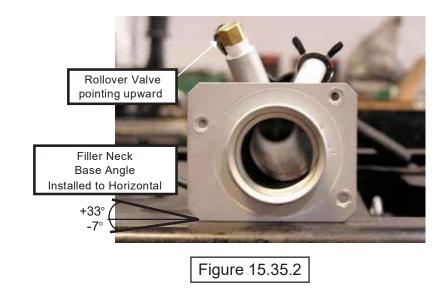

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 12.35.1*.

Filler Neck Installation:

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See *Figure 12.35.2*. for the proper orientation.

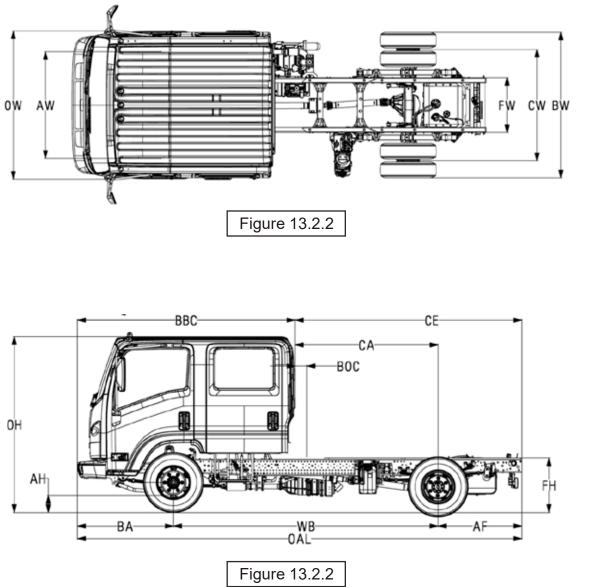

4500XG Diesel Specifications

Model	4500XG Diesel Crew Cab
GVWR	16,000 lbs.
WB	150 in, 176 in.
Engine	Isuzu 4-cylinder, in-line 4-cycle, turbocharged, intercooled, direct injection diesel.
Model/Displacement	4HK1-TC/317 CID (5.19 liters)
HP(Gross)	215 HP @ 2,500 rpm
Torque(Gross)	452 lb-ft torque @ 1,850 rpm
Equipment	Dry element air cleaner with vertical intake; 2 rows 564 square in ² . radiator; 7 blade 20.1 in diameter fan with viscous drive.
	Cold weather starting device and an oil cooler. Engine oil level check. Engine warning system with audible warning for low oil
	pressure, high coolant temperature, and low coolant level. Engine cruise control function.
Transmission	Aisin A465 6 speed automatic transmission with fifth and sixth gear overdrive with lock up in
	2nd, 3rd, 4th, 5th and 6th, PTO capability automatic torque converter lockup in stationary PTO mode.
Steering	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.
Front Axle	Reverse Elliot "I"-Beam rated at 6,830 lbs.
Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.
GAWR	6,630 lbs.
Rear Axle	Full-floating single speed with hypoid gearing rated at 11,020 lb.
Suspension	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.
GAWR	11,020 lbs.
Wheels	19.5 x 6.0-K 6-hole disc wheels, painted white.
Tires	225/70R-19.5F (12 ply) LRR (Low Rolling Resistance) tubeless steel-belted radials, all-season front and rear
	Dual circuit vacuum assisted hydraulic service brakes with EBD (Electronic Brake Distribution) system for load proportioning of
Brakes	the brake system front disc and self-adjust outboard mounted drum rear. The parking brake is a mechanical,
	cable actuated, internal expanding drum type, transmission mounted. The exhaust brake is standard and is vacuum operated.
	4 channel anti-lock brake system.
Fuel Tank	30 gal. (Opt. 35 & 55 gal.) rectangular steel fuel tank mounted in frame rail behind rear axle. Fuel water separator with indicator light.
Frame	Ladder type channel section straight frame rail 33.5 inches wide through the total length of the frame.
	Yield strength 44,000 psi, section modulus 11.89 in., RBM 523,160.
Cab	All-steel 7 passenger low cab forward BBC 109.9 in.
	Tricot breathable cloth covered high back driver's seat with two occupant passenger seat.
Equipment	Four passenger rear bench seat. Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column.
	Power windows and door locks, front floor mats, tinted glass.
Electrical	12 Volt, negative ground, dual maintenance free batteries, 750 CCA each, 140 Amp alternator with integral regulator.
Options	See last page for options.

NOTE: These selected specifications are subject to change without notice.

	4500X G								
	WB	V	Н						
	150	25.3	50.9						
	176	25.3	58.8						

The center of gravity of the completed vehicle with a full load should not exceed 63 inches above ground level for the 16,000 lbs. GVWR, and must be located horizon-tally between the centerlines of the front and rear axles.

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

The maximum dimensions for a body installed on the LCF chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us on gmupfitter.com.

*With 102 inches wide mirror brackets installed in place of standard mirror brackets

Turning Diameters

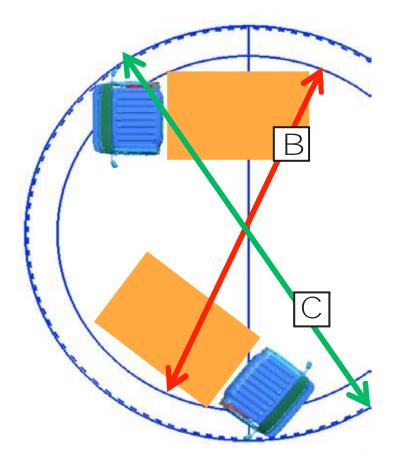

TURNING DIAMETERS

The LCF Series Diesel steering also features a 46.50 inside wheel cut angle. This, coupled with the integral power steering, makes the LCF Series Diesel an extremely maneuverable truck.

Aisin A460 Automatic Torque Converter Lock Up Function.

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the trasmission from the stationary mode.

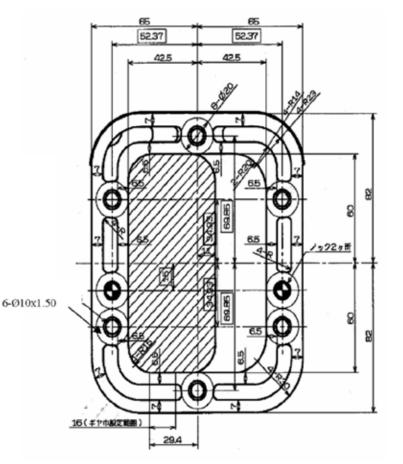

Figure 13.22.1

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door, the decal should be placed above or to the side of the fuel door.

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

12	CAUTION PLATE	See Dealer	1
13	SHUTTER: FUEL TANK	See Dealer	1

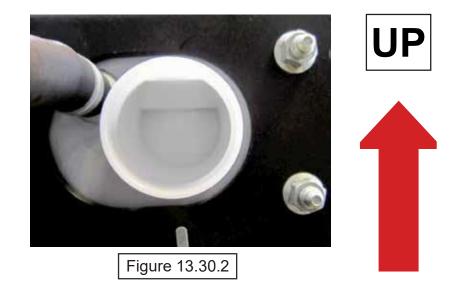

Figure 13.29.2

Figure 13.29.1

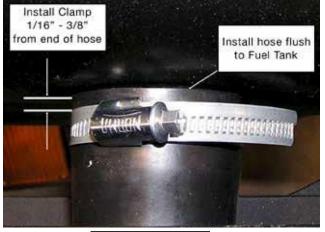

Installation Instructions and Considerations:

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 13.30.1*. This valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figures 13.30.2*.

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16" and 3/8" from the tank. This is shown in *Figure 13.30.3* below.

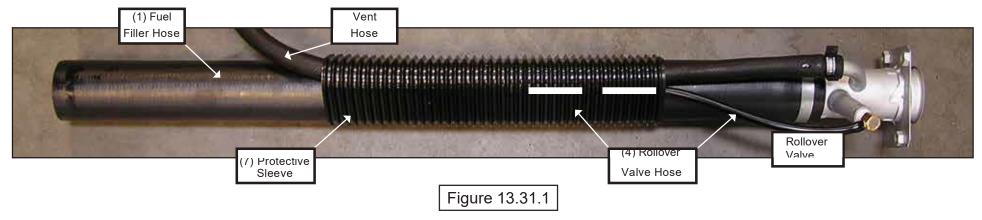

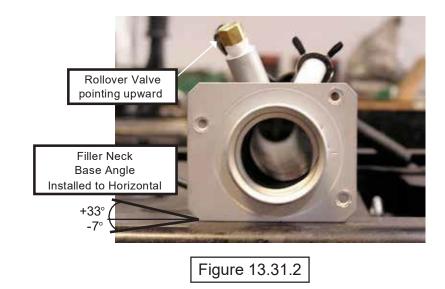

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in *Figure 13.31.1*.

Filler Neck Installation:

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See **FIGURE 13.31.2**. for the proper orientation.

150	24.3	48.3	150	25.3	50.9
176	24.2	55.7	176	25.3	58.8

The center of gravity of the completed vehicle with a full load should not exceed 63 inches above ground level for the 14,500 lbs. and 17,950 lbs. GVWR, and must be located horizontally between the centerlines of the front and rear axles.

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Upfitter site.

The maximum dimensions for a body installed on the LCF Series chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitter Engineering. Contact us on gmupfitter.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

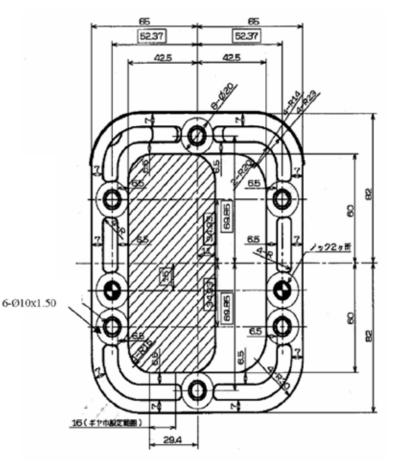

Figure 14.28.2

Opening Diagram

Aisin A460 Automatic Torque Converter Lock Up Function.

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the trasmission from the stationary mode.

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

Figure 14.29.1

Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

Rear View Fuel Fill

NOTE: Shorten hose by "A Dimension" based on chart at left.

Figure 14.33.2

"A" Dimensions:

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door, the decal should be placed above or to the side of the fuel door.

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

LCF-Diesel Fuel Filler Kit Instructions

Please review these instructions prior to installation of the fuel filler kit.

PARTS KIT: Fuel filler kit shown below is used for 14,500 lb and higher GVWR chassis 4500HG, 4500XG, 5500HG, 5500XG. Parts list is shown in *Figure 14.36.2*. Parts photos are shown in *Figure 14.36.1*.

	FUEL FILLER KIT		
ITEM #	PART NAME	PART #	QTY
1	HOSE: FUEL FILLER NECK	See Dealer	1
2	HOSE: FUEL FILLER	See Dealer	1
3	CAP: FILLER	See Dealer	1
4	HOSE: ROLL-OVER VALVE	See Dealer	1
5	NECK ASM: FUEL FILLER	See Dealer	1
6	CLIP: JOINT	See Dealer	4
7	PROTECTOR: FILLER HOSE	See Dealer	1
8	CLIP: BAND, HOSE FIXING	See Dealer	2
9	CLIP: RUBBER, HOSE	See Dealer	1
10	BRACKET: FILLER NECK	See Dealer	1
11	SCREW: FILLER NECK	See Dealer	3
12	CAUTION PLATE	See Dealer	1
13	SHUTTER: FUEL TANK	See Dealer	1

Figure 14.36.2

Figure 14.36.1

Installation Instructions and Considerations:

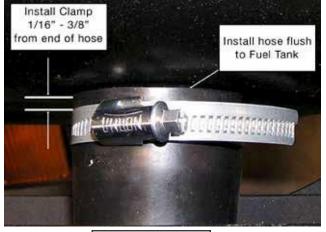

The fuel tank shutter valve (13) was a new component for 2011 model year. This component is meant to improve fuel splash-back performance of the fuel system. This valve (13) is on the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in *Figure 14.37.1*. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in *Figures 14.37.2*.

Figure 14.37.1

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16" and 3/8" from the tank. This is shown in *Figure 14.37.3* below.

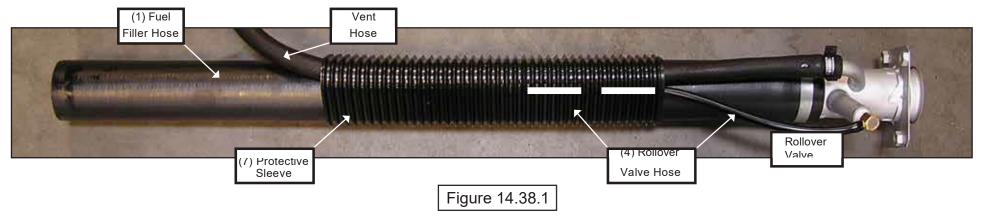

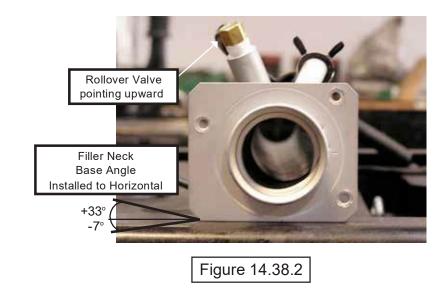

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in **FIGURE 14.38.1**.

Filler Neck Installation:

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See **FIGURE 14.38.2**. for the proper orientation.

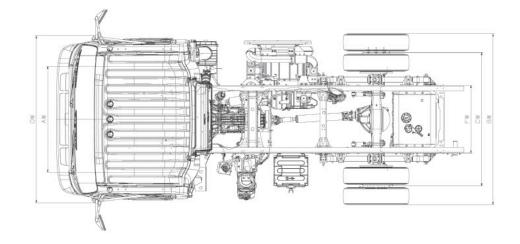

5500XG Diesel - STD Cab Specification

Model	5500X G - STD Cab
GVWR	19,500 lbs.
WB	109 in., 132.5 in., 150 in., 176 in., 200 in., 212 in
Engine	Isuzu 4-cylinder, in-line 4-cycle, turbocharged, intercooled, direct injection diesel.
Model/Displacement	4HK1-TC/317 CID (5.19 liters)
HP (Gross)	215 HP/2500 RPM w auto transmission
Torque (Gross)	452 lb ft torque/1850 RPM w auto transmission
Equipment	Dry element air cleaner with vertical intake; 2 rows 564 square in. radiator; 7 blade 20.1in diameter fan with viscous drive.
	Cold weather starting device and an oil cooler. Engine oil level check switch and light. Engine warning system with audible
	warning for low oil pressure, high coolant temperature, and low coolant level. Engine cruise control function.
	Rear engine cover.
Transmission	Aisin A465 6 speed automatic transmission with fifth and sixth gear overdrive with lock up in 2nd, 3rd, 4th, 5th and 6th, PTO
	capability.
Steering	Integral power steering 18.8-20.9:1 ratio. Tilt and telescoping steering column.
Front Axle	Reverse Elliot "I" -Beam rated at 7,275 lbs.
Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers.
GAWR	7,275 lbs.
Rear Axle	Full floating single speed with hypoid gearing rated at 14,550 lbs.
Suspension	Semi-elliptical steel alloy multi-leaf springs and shock absorbers.
GAWR	14,550 lbs.
Wheels	19.5x6.0-K 6 hole disc wheels, painted white.
Tires	225/70R-19.5E (12 pr) LRR (Low Rolling Resistance) tubeless steel belted radials, all season tread front and rear.
Brakes	Dual circuit power assisted hydraulic service brakes with EBD (Electronic Brake Distribution) system for load
	proportioning of the brake system front disc and self-adjust outboard mounted drum rear. The parking
	brake is mechanical, cable actuated, internal expanding drum type, transmission mounted. The exhaust
	brake is standard and is vacum operated. 4 channell anti-lock brake system.
Fuel Tank	30 gal. (Opt. 35 & 55 gal.) rect. steel fuel tank mounted in frame rail behind rear axle. Fuel water separator with dash mounted indicator light
Frame	Ladder type channel section straight frame rail 33.5 in wide through the total length of the frame. Yield strength 44,000 psi,
	section modulus 7.20 in ³ . RBM 316,800.
Cab	All steel low cab forward, BBC 70.9 in, 45° mechanical tilt with torsion assist.
	TRICOT breathable cloth covered high back driver's seat with two occupant passenger seat.
Equipment	Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column.
	Power windows and door locks, floor mats, tinted glass, AM/FM CD stereo radio.
Electrical	12 Volt, negative ground, dual Delco maintenance free batteries, 750 CCA each, 140 Amp alternator with integral regulator.
Options	See last page for options.

NOTE: These selected specifications are subject to change without notice.

Truck Weight Limits

Truck Weight Limits:

GVWR Designed Maximum 19,500 lbs.

GAWR, Front 7,275 lbs.

GAWR, Rear 13,660 lbs.

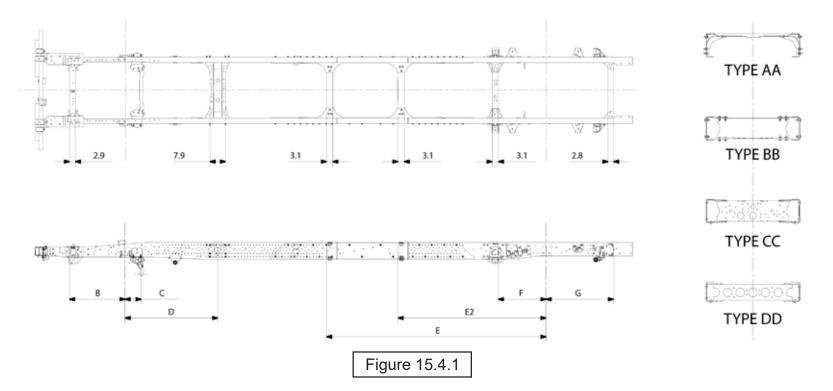

Technical Notes:

Chassis Curb Weight reflects standard equipment and fuel, but no driver or payload.

Maximum Payload Weight is the allowed maximum for equipment, body, payload and driver and is calculated by subtracting chassis curb weight from the GVWR

	Weights for Options

212	23.2	85.2	N/A

Center of Gravity

The center of gravity of the chassis cab.

The maximum vertical center of gravity specified be- low must not be exceeded at maximum GVWR and rated front and rear GAWR. The Center of Gravity (CG) maximum is 63" (1600 mm) above the ground.(LCF Cab Chassis and LCF Stripped Chassis).

Figure 15.16.2

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet LCF Incomplete Vehicle Document and the GM Body Builders Guide.

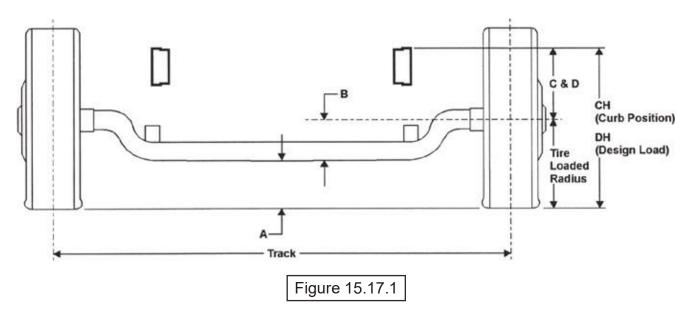

The maximum dimensions for a body installed on the N Series chassis are 102 inches wide (outside*) by 91 inches high (inside). Any larger body applications must be approved by GM Upfitters Engineering. Contact us on gmupfitter.com.

* With 102 inches wide mirror brackets installed in place of standard mirror brackets

Figure 15.25.2

Opening Diagram

Aisin A460 Automatic Torque Converter Lock Up Function.

In either the Stationary Preset PTO Mode or Stationary Variable PTO Mode, when engine rpm exceeds 1200 RPM, the torque converter will lock up. The engine rpm can not be modified and the lockup function cannot be turned off. Please not that with PTO applications that operate around 1200 RPM, the transmission software holds the torque converter in lockup until engine speed falls below 1100 RPM

The lock up function will cancel if the transmission shift lever is moved from the park or neutral positions which will remove the trasmission from the stationary mode.

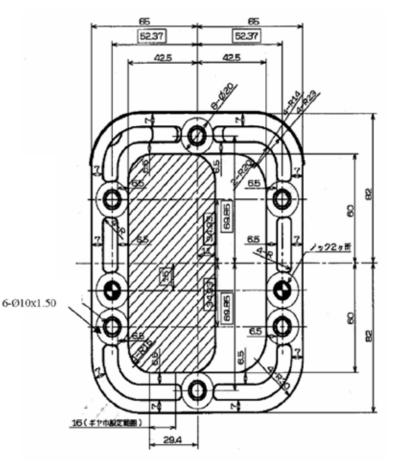

Figure 15.26.1

Additional PTO Functions

For certain applications the Automatic regeneration function can be inhibited (Example Airport Ground Support vehicles).

For certain applications the Automatic regeneration function can be enabled in the PTO stationary mode (Example Lawn care and carpet cleaning).

For certain applications the Automatic regeneration function can be enabled in the PTO mobile mode (Example Line painting).

Please refer to the PTO section of the BBG (section 17) for further details.

Diesel Fuel Fill

Installation Instructions

- 1. Disconnect battery.
- 2. Loosen hose from the tie downs. Remove caps from plate on rail.
- 3. Install hoses onto the plate.
- 4. Extend hose out from the driver side of the rail to body rail.
- 5. The filler neck must be mounted to allow the fill plate bracket to be parallel to the frame horizontal.
- 6. Cover with protector wrap and secure with tie wraps.
- 7. Filler hose is set for 102 inches outside width body.
- 8. Filler neck (dimension A) must be between 6.85 inches and 8.5 inches above frame.
- 9. Secure the filler plate to the bottom of the body and check for leaks.
- 10. Ensure that fill hose does not sag, creating an area where the fuel could pool in the fill hose.
- 11. Reconnect battery.

Ultra Low Sulfur Diesel Label

Per EPA Title 40, Part 86, 86:007—35(c), The decal illustrated below must be installed on the vehicle. The decal is included in the fuel fill parts box.

INSTRUCTIONS FOR DECAL PLACEMENT:

1. The decal must be placed as close as possible to the fuel inlet and be clearly visible.

2. The decal should be placed above or to the side of the fuel cap to avoid corrosion by possible contact with fuel.

3. The decal may be placed on aerodynamic fairings, bodies, etc. as long as the decal is clearly visible and in close proximity to the fuel inlet.

4. For installed bodies that have a fuel door, the decal should be placed above or to the side of the fuel door.

Thoroughly clean the area of all grease, dirt, etc. before application of the decal. Apply the decal at room temperature, 65° to 75° F.

LCF-Diesel Fuel Filler Kit Instructions

Please review these instructions prior to installation of the fuel filler kit.

PARTS KIT: Fuel filler kit shown below is used for 14,500 lb and higher GVWR chassis 4500HG, 4500XG, 5500HG, 5500XG. Parts list is shown in **FIGURE 15.32.2.** Parts photos are shown in **FIGURE 15.32.1.**

	FUEL FILLER KIT		
ITEM #	PART NAME	PART #	QTY
1	HOSE: FUEL FILLER NECK	See Dealer	1
2	HOSE: FUEL FILLER	See Dealer	1
3	CAP: FILLER	See Dealer	1
4	HOSE: ROLL-OVER VALVE	See Dealer	1
5	NECK ASM: FUEL FILLER	See Dealer	1
6	CLIP: JOINT	See Dealer	4
7	PROTECTOR: FILLER HOSE	See Dealer	1
8	CLIP: BAND, HOSE FIXING	See Dealer	2
9	CLIP: RUBBER, HOSE	See Dealer	1
10	BRACKET: FILLER NECK	See Dealer	1
11	SCREW: FILLER NECK	See Dealer	3
12	CAUTION PLATE	See Dealer	1
13	SHUTTER: FUEL TANK	See Dealer	1

Figure 15.33.2

Figure 15.33.1

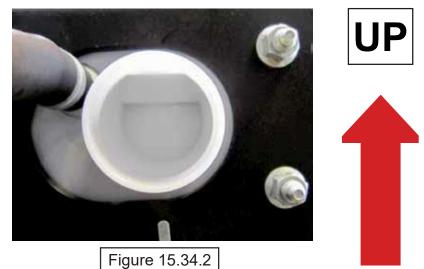

Installation Instructions and Considerations:

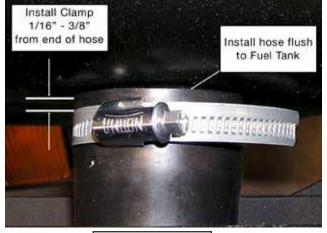

The fuel tank shutter valve (13) is meant to improve fuel splash-back performance of the fuel system. This valve (13) is relocated on the fuel tank inlet to the inlet (outboard side) of the fuel filler neck bulkhead assemble that is bolted to the left hand frame rail as shown in **FIGURE 15.34.1**. This plastic valve snaps into place in the inlet of the frame mounted fuel pipe. The valve should be installed so that the plastic clip is at the top of the valve, so that the flap door opens up, as shown in **FIGURE 15.34.2**.

Figure 15.34.1

The fuel filler hose should be installed flush against the tank. The clamp should be installed between 1/16" and 3/8" from the tank. This is shown in **FIGURE 15.34.3** below.

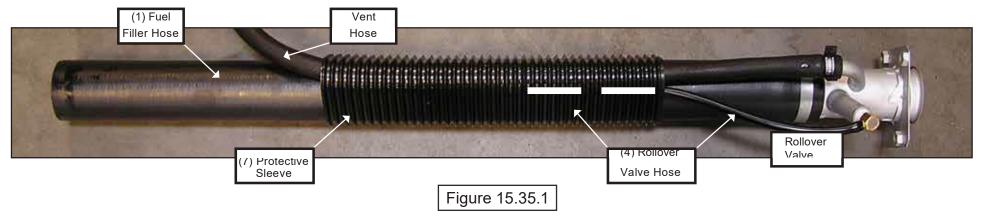

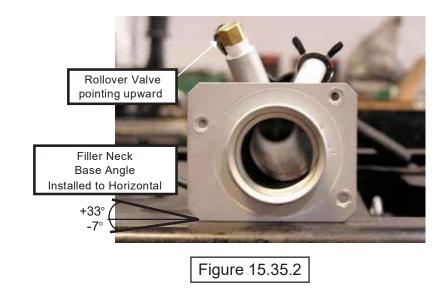

Roll-Over Valve Tubing

The roll-over valve has a hose attachment that will make this valve less sensitive to water intrusion. In order for the valve to work properly, it is critical that the hose be installed to the rollover valve. The proper assembly of the outer hose is shown in **FIGURE 15.35.1**.

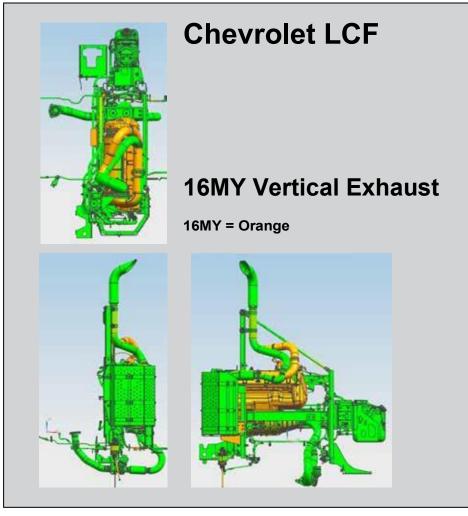

Filler Neck Installation:

The fuel filler neck (5) must be installed with the proper orientation on the body. The neck should be installed with the roll-over valve pointing upward, with the bottom edge of the neck oriented parallel to the ground, plus 33 to minus 7 degrees. See **FIGURE 15.35.2**. for the proper orientation.

Vertical Exhaust LCF Diesel Only

- Available on 4500HG, 4500XG, 5500HG, 5500XG
- Vertical exhaust is available on 109, 132.5, 150, 176, 200, and 212 inch wheelbases
- Option Code NPV
- Not available with 6.0L Gas Engine
- Available as a port installed option only
- Available with Automatic transmission only
- Available with in rail fuel tank only
- · Available with single cab only

Transmission	Allison 2550 RDS 6 speed automatic transmission. A single PTO opening on the left hand side of the transmission with a maximum torque value of 250 lb-ft.
Steering	Integral power steering. Tilt and Telescoping steering column. Steering ratio of 22.4:1
Front GAWR	12,000 lbs.
Front Axle	Dana E-1254W reverse Elliot "I"-Beam type steer axle rated at 12,000 lbs.
Front Suspension	Semi-elliptical steel alloy tapered leaf springs with stabilizer bar and shock absorbers, rated at 12,000 lbs.
Rear GAWR	19,000 lbs. / 21,000 lbs.
Rear Axle	Dana S19-140 single-speed, 21,000 lbs. capacity drive axle.
Rear Suspension	Semi-elliptical steel alloy multi-leaf springs rated at 21,000 lbs. / 21,000 lbs.
	Air spring suspension with single leveling valve, dual shock absorbers, and an in cab dump/fill switch rated at 23,000 lbs.
Wheels	22.5 x 8.25 inch 10 hole disc wheels
Tires	Low rolling resistance tubeless steel belted radials, premium highway tread front tread and premium highway traction rear tread.
Brakes	Dual circuit S-CAM drum air service brakes with 4 channel anti-lock brake system. An air operated exhaust brake, air controlled parking brake, heated air dryer, and automatic slack adjusters are standard.
Fuel Tank	50 / 100 gal. 6500XD / 100-gal7500XD rectangular aluminum fuel tank mounted on left hand frame. Includes a fuel water separator with indicator light.
Frame	Ladder type channel section straight frame rail, 33.5 in wide along the total length of the frame. Yield strength 80,000 psi; Section Modulus 12.69 cub. In, RBM 1,015,000 lb-in
Cab	All steel low cab forward, BBC 81.5 in, 45 degree mechanical tilt with torsion assist.
Cab Equipment	TRICOT breathable cloth covered high back air ride driver's seat with rigid passenger seat and center seat with fold down back. Dual cab mounted exterior mirrors with integral convex mirror. Tilt and telescoping steering column. Power windows and door locks, floor mats, tinted glass, AM/FM/CD stereo radio with Bluetooth. Rear body dome lamp switch.
Electrical	12 Volt, negative ground, dual maintenance free batteries with threaded posts, 750 CCA each, 140 Amp alternator with integral regulator.
Options	See page 6 for options

NOTE: These selected specifications are subject to change without notice.

Vehicle Weights, Dimensions and Ratings

Multi-leaf Suspension

	VEHICLE WEIGHT LIMITS	
Rating	Tire	Capacity
GVWR Designed Maximum	All tire options	25,950 lb
GCWR Combined Maximum	All tire options	30,000 lb
Front GAWR	11R22.5G tires	12,000 lb
FIONUGAWK	255/70R22.5H tires	11,000 lb
Rear GAWR	All tire options	19,000 lb

FINAL WEIGHT CHART PENDING

Notes:

[1] Chassis Curb Weight reflects standard equipment and fuel, but no driver or payload.

[2] Maximum Payload Weight is the allowed maximum for equipment, body, payload and driver and is calculated by subtracting chassis curb weight from the GVWR.

Revision: 05/31/23

Center of Gravity

NOTE: The Final Manufacturer must ensure that the combined vertical center of gravity of the chassis, body, and available payload at full GVW does not exceed the maximum vertical center of gravity outlined in the Chevrolet Incomplete Vehicle Document (IVD).

The maximum vertical center of gravity of the total vehicle at maximum GVWR is not to exceed 70 inches (1778 mm) above the ground. If a higher completed vehicle vertical center of gravity is required, please contact Chevrolet Commercial Truck application engineering.

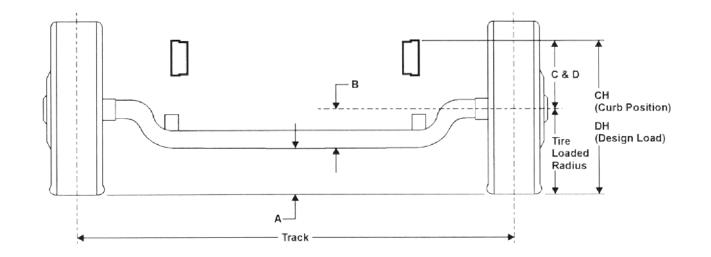

Note: Dimensions in inches

Front Axle Chart

Formulas for calculating height dimensions:

A =	Tire Loaded Radius – B
-----	------------------------

C = Centerline of Axle to Top of Frame Rail at Curb Position

D = Centerline of Axle to Top of Frame Rail at Design Load

CH = C + Tire Unloaded Radius

DH = D + Tire Loaded Radius

TIRE	GVWR	GAWR	А	В	С	D	СН	DH	TRACK
11R22.5G	25,950 lb.	12,000 lb.	10.0	9.4	20.0	18.6	40.8	38.0	81.4
255/70R22.5H	25,950 lb.	11,000 lb.	7.7	9.4	20.0	18.6	38.3	35.7	81.4

Figure 21

Note: Dimensions in inches

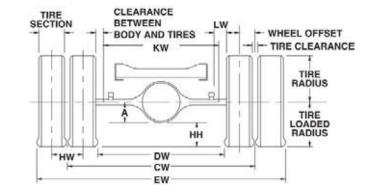

Rear Axle Chart

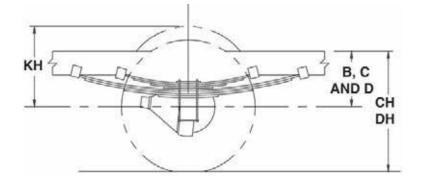

Definition	S							
А	Centerline of axle to bottom of axle bowl.							
В	Centerline of axle to top of frame rail at metal-to-metal position.							
С	Centerline of axle to top of frame rail at curb position.							
D	Centerline of axle to top of frame rail at design load.							
	Rear Tire Clearance: Minimum clearance required for tires measured from the top of the							
Е	frame at the vehicle centerline of the rear axle, when rear wheels on one side ride over a high							
	spot.							
СН	Rear Frame Height (Curb Load): Vertical distance between the normal top of frame rail and							
СП	the ground-line through the centerline of the rear axle at curb position.							
DH	Rear Frame Height (Design Load): Vertical distance between the normal top of frame rail and							
DH	the ground-line through the centerline of the rear axle at design position.							
DW	Minimum distance between the inner surfaces of the rear tires.							
EW	Minimum Rear Width: Overall width of the vehicle measured at the outermost surfaces of the							
EVV	rear tires.							
НН	Rear Tire Clearance: Minimum clearance between the rear axle and the ground-line.							
HW	Dual Tire Spacing: Distance between the centerlines of the tires in a set of dual tires.							
КН	Tire Bounce Clearance: Minimum distance required for tire bounce as measured from the							
КΠ	centerline of the rear axle and the top of the rear tire when one wheel rides over a high spot.							
CW	Track Dual Rear Wheel Vehicle: Distance between the centerlines of the dual wheels							
CVV	measured at the ground-line.							
KW	Clearance between body and tires.							
Equations								
СН	= Tire loaded radius + C							
DH	= Tire loaded radius + D							
DW	= CW + 2 tire sections - tire clearance							
EW	= CW + 2 tire sections + tire clearance							
HH	= Tire loaded radius - A							
JΗ	= KH - B							
КН	= Tire radius + 3.0 inches							
KW	= DW - 5.0 inches							
LW	= 1.0 inch minimum clearance between tires and springs
