

UI Bulletin #202

Backup Alarm Installation Recommendations **Subject:**

Models Years

2020-Beyond Affected:

Models Chevrolet Silverado/GMC Sierra Affected:

2500/3500 HD Series

Origination June 13, 2024

Date:

Revision **TBD** Date:

ADVISORY:

Condition/Concern:

Some customers, dealers, or upfitters may have concerns or questions about adding a backup alarm to vehicles that do not have option code 8S3. They may notice that the alarm sounds when the customer is entering or exiting the vehicle, due to the backup lamps being activated with the perimeter lighting and key fob acknowledgment.

Repair/Recommendations:

To avoid operation upon entry and exit from the vehicle there are two options we will discuss.

1. Have a GM dealer reprogram the vehicle's Body Control Module to include the SFW [backup alarm calibration] option. This calibration permanently disables the perimeter lighting feature and will eliminate the activation of the back-up alarm when exiting and/or key fob activation. The back-up alarm can then be wired directly to the back-up lamp circuit directly and will operate (alarm sounded) when the vehicle is in reverse, and the back-up lamps are illuminated.

Note: An administrative fee is applicable, and this fee is typically passed on to the customer and is in addition to the labor charges by the dealer for the reprogramming event.

2. Install an ignition-controlled relay to connect the backup alarm to the backup lamp circuit. This setup ensures that the backup alarm will only function when the ignition is on, and the backup lamps are illuminated (see the sample mechanism below).

Note: Ignition source can be found in the X260/X213A upfitter connector - pin 13, up under the IP. See <u>UI TSB</u> 155x for more information on the location and connector diagram.

Additional Information:

Refer to page 51 of GM Upfitter Integration <u>Electric Best Practices manual</u> for recommendation on performing multiple wire splices (GM UI Electrical Best Practices)
